INTRODUCTION
Project Overview

Project Goals

This Community Health Needs Assessment — a follow-up to similar research conducted in the area in 2002, 2005 and 2010 — is a systematic, data-driven approach to determining the health status, behaviors and needs of residents in LaSalle Parish. Subsequently, this information may be used to inform decisions and guide efforts to improve community health and wellness.

Community Defined for This Assessment

This report focuses on data specific to LaSalle Parish, Louisiana, but this study is part of a larger study across the nine-parish Rapides Foundation Service Area (RFSA) in Central Louisiana. Data for the RFSA are also provided throughout this report.

Methodology

2013 PRC Community Health Survey

Survey Instrument

The survey instrument used for this study is based largely on the Centers for Disease Control and Prevention (CDC) Behavioral Risk Factor Surveillance System (BRFSS), as well as various other public health surveys and customized questions addressing gaps in indicator data relative to health promotion and disease prevention objectives and other recognized health issues. The final survey instrument was developed by The Rapides
Foundation and Professional Research Consultants (PRC), and is similar to the previous surveys used in the region, allowing for data trending.

Sample Approach & Design

A precise and carefully executed methodology is critical in asserting the validity of the results gathered in the 2013 PRC Community Health Survey. Thus, to ensure the best representation of the population surveyed, a telephone interview methodology (which includes both landlines and cell phones) was employed. The primary advantages of telephone interviewing are timeliness, efficiency and random-selection capabilities.

The sample design used for this effort consisted of a random sample of 200 adults age 18 and older in LaSalle Parish. In total, 3,742 surveys were completed across the Rapides Foundation Service Area; once these data were collected, the sample was weighted in proportion to the actual population distribution at the parish level so that estimates better reflect the region as a whole. Population estimates were based on census data of adults age 18 and over provided through GeoLytics Demographic Estimates and Projections.

All administration of the surveys, data collection and data analysis was conducted by Professional Research Consultants, Inc. (PRC).

Sampling Error

For statistical purposes, the maximum rate of error associated with a sample size of 200 respondents is ±6.9% at the 95 percent level of confidence.
Sample Characteristics

To accurately represent the population studied, PRC strives to minimize bias through application of a proven telephone methodology and random-selection techniques. And, while this random sampling of the population produces a highly representative sample, it is a common and preferred practice to “weight” the raw data to improve this representativeness even further. This is accomplished by adjusting the results of a random sample to match the demographic characteristics of the population surveyed (poststratification), so as to eliminate any naturally occurring bias. Specifically, once the raw data are gathered, respondents are examined by key demographic characteristics (namely gender, age, race, ethnicity, and poverty status) and a statistical application package applies weighting variables that produce a sample which more closely matches the population for these characteristics. Thus, while the integrity of each individual’s responses is maintained, one respondent’s responses may contribute to the whole the same weight as, for example, 1.1 respondents. Another respondent, whose demographic characteristics may have been slightly oversampled, may contribute the same weight as 0.9 respondents.

The following chart outlines the characteristics of the LaSalle Parish sample for key demographic variables, compared to actual population characteristics revealed in census data. [Note that the sample consisted solely of area residents age 18 and older; data on children were given by proxy by the person most responsible for that child’s healthcare needs, and these children are not represented demographically in this chart.]

![Population & Survey Sample Characteristics Chart](chart.png)

Further note that the poverty descriptions and segmentation used in this report are based on administrative poverty thresholds determined by the US Department of Health & Human Services. These guidelines define poverty status by household income level and number of persons in the household (e.g., the 2013 guidelines – the most current available – place the poverty threshold for a family of four at $23,550 annual household income or lower). In sample segmentation: “Very Low Income” refers to community members living in a household with defined poverty status; “Low Income” includes those households living just above the poverty level, earning up to twice the poverty threshold; and “Middle/High Income” refers to households with incomes more than twice the poverty threshold defined for the household size.
The sample design and the quality control procedures used in the data collection ensure that the sample is representative. Thus, the findings may be generalized to the total population of community members in the defined area with a high degree of confidence.

Public Health, Vital Statistics & Other Data

A variety of existing (secondary) data sources was consulted to complement the research quality of this Community Health Needs Assessment. Data for LaSalle Parish were obtained from the following sources (specific citations are included with the graphs throughout this report):

- Agenda for Children/KIDS COUNT Data Center
- Centers for Disease Control & Prevention
- ESRI BIS Demographic Portfolio (Projections Based on the US Census)
- Louisiana Department of Health and Hospitals Office of Public Health
- Louisiana State Center for Health Statistics
- National Center for Health Statistics
- www.countyhealthrankings.org

Benchmark Data

Trending

Similar surveys were administered in the region in 2002, 2005 and 2010 by PRC on behalf of The Rapides Foundation. Trending data, as revealed by comparison to prior results, are provided throughout this report whenever available.

RFSA Risk Factor Data

Regional risk factor data for Central Louisiana (the nine-parish Rapides Foundation Service Area or RFSA) are also provided as an additional benchmark against which to compare local findings.

Louisiana Risk Factor Data

Statewide risk factor data are provided where available as an additional benchmark against which to compare local findings. These data are reported in the most recent BRFSS (Behavioral Risk Factor Surveillance System) Prevalence and Trend Data published by the Centers for Disease Control and Prevention and the US Department of Health & Human Services. NOTE: Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.

Nationwide Risk Factor Data

Nationwide risk factor data, which are also provided in comparison charts, are taken from the 2013 PRC National Health Survey (as well as previous PRC National Health Surveys). The methodological approach for the national study is identical to that employed in this assessment, and these data may be generalized to the US population with a high degree of confidence.
Healthy People 2020 provides science-based, 10-year national objectives for improving the health of all Americans. The Healthy People initiative is grounded in the principle that setting national objectives and monitoring progress can motivate action. For three decades, Healthy People has established benchmarks and monitored progress over time in order to:

- Encourage collaborations across sectors.
- Guide individuals toward making informed health decisions.
- Measure the impact of prevention activities.

Healthy People 2020 is the product of an extensive stakeholder feedback process that is unparalleled in government and health. It integrates input from public health and prevention experts, a wide range of federal, state and local government officials, a consortium of more than 2,000 organizations, and perhaps most importantly, the public. More than 8,000 comments were considered in drafting a comprehensive set of Healthy People 2020 objectives.

Key Informant Focus Group

As part of the community health assessment, one focus group was held on March 20. Focus group participants included 7 key informants: physicians, other health professionals, social service providers, and other community leaders.

A list of recommended participants for the focus group was provided by the sponsors. Potential participants were chosen because of their ability to identify primary concerns of the populations with whom they work, as well as of the community overall. Participants included a representative of public health, as well as several individuals who work with low-income, minority or other medically underserved populations, and those who work with persons with chronic disease conditions.

Focus group candidates were first contacted by letter to request their participation. Follow-up phone calls were then made to ascertain whether or not they would be able to attend. Confirmation calls were placed the day before the group was scheduled to insure a reasonable turnout.

Audio from the focus group session was recorded, from which verbatim comments in this report are taken. There are no names connected with the comments, as participants were asked to speak candidly and assured of confidentiality.

NOTE: These findings represent qualitative rather than quantitative data. The group was designed to gather input from participants regarding their opinions and perceptions of the health of the residents in the area. Thus, these findings are based on perceptions, not facts.

Information Gaps

While this assessment is quite comprehensive, it cannot measure all possible aspects of health in the community, nor can it adequately represent all possible populations of interest. It must be recognized that these information gaps might in some ways limit the ability to assess all of the community’s health needs.
For example, certain population groups — such as the homeless, institutionalized persons, or those who only speak a language other than English or Spanish — are not represented in the survey data. Other population groups — for example, pregnant women, lesbian/gay/bisexual/transgender residents, undocumented residents, and members of certain racial/ethnic or immigrant groups — might not be identifiable or might not be represented in numbers sufficient for independent analyses.

In terms of content, this assessment was designed to provide a comprehensive and broad picture of the health of the overall community. However, there are certainly a great number of medical conditions that are not specifically addressed.
Summary of Findings

Significant Trends in LaSalle Parish

The following table highlights both positive and negative trends observed in health indicators in comparison with baseline data.

<table>
<thead>
<tr>
<th><strong>FAVORABLE TRENDS</strong></th>
<th><strong>UNFAVORABLE TRENDS</strong></th>

Belief People Should Definitely Not Smoke  
Smokeless Tobacco |
Top Community Health Concerns Among Focus Group Participants

Among Community Key Informants

At the conclusion of the key informant focus group, participants were asked to write down what they individually perceive as the top five health priorities for the community, based on the group discussion as well as on their own experiences and perceptions. Their responses were collected, categorized and tallied to produce the top-ranked priorities as identified among key informants. These should be used to complement and corroborate findings that emerge from the quantitative dataset.

1. Mental Health (tied)
2. Access to Healthcare Services
3. Physical Activity
4. Obesity (tied)
5. [Additional responses listed, not fully visible in the provided text]

Comparisons With Benchmark Data

The following tables provide an overview of indicators in LaSalle Parish. These data are grouped to correspond with the Focus Areas presented in Healthy People 2020.

Reading the Summary Tables

- In the following charts, LaSalle Parish results are shown in the larger, blue column.
- The orange columns to the right of the LaSalle Parish column provide comparisons between LaSalle Parish and any available regional, state and national findings, as well as Healthy People 2020 targets. Symbols indicate whether LaSalle Parish compares favorably (●), unfavorably (▲), or comparably (□) to these external data.
- The pink column (far right) provides trending results. Symbols indicate whether LaSalle Parish has changed favorably (●), unfavorably (▲), or is statistically unchanged (□) compared to baseline data (i.e., the earliest data presented in this report).

Health Insurance Coverage

Type of Healthcare Coverage

A total of 58.3% of LaSalle Parish adults age 18 to 64 report having healthcare coverage through private insurance. Another 25.6% report coverage through a government-sponsored program (e.g., Medicaid, Medicare, military benefits).

Healthcare Insurance Coverage
(Among Adults Age 18 to 64; LaSalle Parish, 2013)

Hospital & Physician Coverage

Among insured adults, the vast majority (98.8%) are at least partially covered for both physician and hospital visits.

- Statistically similar to the regional (RFSA) prevalence.
- Marks a modest (but statistically significant) increase from the 2005 survey results. Note that this item was not addressed in the initial 2002 survey.

Aspects of Healthcare Coverage
(Among Insured Adults, Excluding Medicare-Only; 2013)
Prescription Drug Coverage

Among insured adults (excluding those with Medicare), 95.8% report having prescription coverage as part of their insurance plan.

- Comparable to the RFSA figure.
- Marks a statistically significant increase since 2005.

Insurance Covers At Least Partial Prescriptions
(Among Insured Respondents, Excluding Those With Medicare; 2013)

Supplemental Medicare Coverage

Among Medicare recipients, 56.5% report that they have additional supplemental insurance.

- Comparable to what is found throughout the RFSA.
- Lower than the prevalence among Medicare recipients nationwide.
- Statistically unchanged in LaSalle Parish since the 2005 survey.

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. (Item 78)
Notes: Asked of all respondents with Medicare coverage.
Lack of Health Insurance Coverage

Among adults age 18 to 64, 16.1% report having no insurance coverage for healthcare expenses.

- More favorable than found regionally.
- More favorable than the state finding.
- Similar to the current national finding.
- The Healthy People 2020 target is universal coverage (0% uninsured).
- The prevalence of adults under 65 without healthcare insurance coverage has remained statistically unchanged in LaSalle Parish since 2002.

The following chart further examines lack of insurance coverage by various key demographic characteristics. Note that the following population segments are more likely to be without healthcare insurance coverage:

- Residents living at lower incomes
Impact of Poor Access

Uninsured adults in LaSalle Parish are much less likely to receive routine care and preventive health screenings, and much more likely to encounter healthcare access difficulties.

Preventive Healthcare
(By Insured Status; LaSalle Parish, 2013)

Sources:
- 2011 PRC Community Health Survey, Professional Research Consultants, Inc. [Items 18, 40, 41, 210, 213]

Notes:
- Asked of all respondents.
Access to quality care is important to eliminate health disparities and increase the quality and years of healthy life for all persons in the United States. Access to high-quality healthcare across each of the components in the continuum of care must be improved to realize the full potential of prevention. For example, success in reducing the burden of heart disease and narrowing the gap in heart disease outcomes between different racial groups will depend on several factors. These factors include ensuring access to clinical preventive services, such as blood pressure and cholesterol screening; effective primary care to educate people about modifiable risk factors, such as smoking, and to manage effectively chronic conditions like hypertension; high-quality emergency services to improve outcomes of acute cardiac events; and access to rehabilitative and long-term care for heart disease patients.

Improving access to appropriate preventive care requires addressing many barriers, including those that involve the patient, provider, and system of care. Patient barriers include lack of knowledge, skepticism about the effectiveness of prevention, lack of a usual source of primary care, and lack of money to pay for preventive care. Having health insurance, a high income, and a primary care provider are strong predictors that a person will receive appropriate preventive care.

**Difficulties Accessing Services**

A total of 35.3% of LaSalle Parish adults report some type of difficulty or delay in obtaining healthcare services in the past year.

- Similar to what was found throughout the RFSA.
- Similar to the national figure.
- Statistically unchanged since 2002.

**Experienced Difficulties or Delays of Some Kind in Receiving Needed Healthcare in the Past Year**

Sources: ● PRC Community Health Surveys, Professional Research Consultants, Inc. (Item 213)
● 2013 PRC National Health Survey, Professional Research Consultants

Notes: ● Asked of all respondents
Note that the following demographic groups more often report difficulties accessing healthcare services:

- Women.
- Very low and low income residents.

**Experienced Difficulties or Delays of Some Kind in Receiving Needed Healthcare in the Past Year**

(LaSalle Parish, 2013)

To better understand healthcare access barriers, survey participants were asked whether any of six types of barriers to access prevented them from seeing a physician or obtaining a needed prescription in the past year.

Again, these percentages reflect the total population, regardless of whether medical care was needed or sought.

**Barriers to Healthcare Access**

Of the tested barriers, cost of doctor visits impacted the greatest share of LaSalle Parish adults (17.2% say that cost prevented them from obtaining necessary doctor care).

- With the exception of transportation, the proportion of LaSalle Parish adults impacted was statistically comparable to or better than that found both regionally and nationwide for each of the tested barriers.

**Barriers to Access Have Prevented Medical Care in the Past Year**
Compared to baseline 2002 data, LaSalle Parish has remained unchanged for each of the surveyed barriers, with the exception of prescription costs (which are more favorable over time).

**Trend in Access Barriers**
(LaSalle Parish)

As might be expected, those without health insurance are much more likely to report access barriers when compared to the insured population in LaSalle Parish.

**Barriers to Healthcare Access**
(By Insured Status, 18+; LaSalle Parish, 2013)

Surveyed parents were also asked if, within the past year, they experienced any trouble receiving medical care for a randomly-selected child in their household.

A total of 11.9% of parents say there was a time in the past year when they needed medical care for their child, but were unable to get it.

- Much higher than what is found throughout the RFSA.
- Similar to the percentage reported nationwide.
- Marks no significant change over time.
Related Focus Group Findings: Access to Healthcare Services

Many of the key informants participating in the focus group are concerned with access to healthcare, discussing such issues as:

- Good access to healthcare services
- Native American population
- Limited number of primary care providers

Participants agree that residents have good access to healthcare services in the parish. However, key informants express concern for the Native American population living in LaSalle Parish. This community has higher rates of obesity, diabetes, hypertension and alcoholism.

In general, respondents think that residents can access a medical provider when needed. The parish has two hospitals and specialists that come one to three days a week, but remains very busy, so getting an appointment can be difficult. Attendees believe that Medicaid recipients and uninsured residents also have relatively good access to healthcare providers and if necessary emergency rooms are available.

“Well, as you know, you can always, always day or night go to the emergency room. It doesn’t matter if you got a nickel to your name. You can go, and you will not be turned away. So, there is that ultimate access. I mean, in our clinic, which would be me and two nurse practitioners; we have a large number of patients. We have a good number of Medicare patients. We have a lot of patients who have no insurance. I mean, I think they have access.” — LaSalle Parish Key Informant

However, focus group members worry about the limited number of primary care providers that work in the parish because of the area’s rural nature. Attendees worry that when the current, older physicians retire, no younger providers will take their place.
"I’m a physician, and one of the issues is we don’t have any young doctors. I mean, I’m 63. Dr. Turnly is 80 plus, and Dr. Ericson is over 40. And, that’s primary care doctors that actually live here. So, we have to get young doctors.” — LaSalle Parish Key Informant

The hospital systems work hard to recruit younger medical residents, but struggle because of the lower starting salary, and lack of entertainment, or cultural opportunities for spouses.

“We can’t pay like some of the larger hospitals can. And, my assessment for rural communities, we are doing well. But, when you compare yourself with some of the other cities – larger metropolitan areas – we can’t compete salary wise.” — LaSalle Parish Key Informant
Primary Care Services

Improving primary care across the nation depends in part on ensuring that people have a usual source of care. Having a primary care provider as the usual source of care is especially important because of the beneficial attributes of primary care. These benefits include the provision of integrated, accessible healthcare services by clinicians who are accountable for addressing a large majority of personal healthcare needs, developing a sustained partnership with patients, and practicing in the context of family and community. Increasing the number and proportion of members of underrepresented racial and ethnic groups who are primary care providers also is important because they are more likely to practice in areas where health services are in short supply and in areas with high percentages of underrepresented racial and ethnic populations.

Specific Source of Ongoing Care

A total of 80.3% of LaSalle Parish adults were determined to have a specific source of ongoing medical care.

- Higher than regional (RFSA) findings.
- Statistically similar to national findings.
- Fails to satisfy the Healthy People 2020 target.
- Statistically increased in LaSalle Parish since 2005.

When viewed by demographic characteristics, the following population segments are less likely to have a specific source of care:

- Men.
- Young adults (under age 40).
Type of Place Used for Medical Care

When asked where they usually go if they are sick or need advice about their health, the greatest share of respondents (39.9%) identified a particular doctor’s office (compared to the 45.8% reported nationwide).

A total of 36.1% say they usually go to some type of clinic (higher than the 26.2% across the US), while 2.5% visit some type of military/VA facility (similar to the 3.1% national prevalence) and 4.4% rely on a hospital emergency room (higher than the 2.7% US figure).

Particular Place Utilized for Medical Care
(LaSalle Parish, 2013)
Routine Medical Care

Adults

A total of 74.6% of adults visited a physician for a routine checkup in the past year.

- Similar to regional (RFSA) findings.
- More favorable than national findings.
- Statistically unchanged from baseline findings.

Medically Underserved Areas/Populations (MUAs/MUPs)

Medically Underserved Areas/Populations are areas or populations designated by the U.S. Department of Health and Human Services Health Resources and Services Administration (HRSA) as having: too few primary care providers; high infant mortality; high poverty; and/or high elderly population.

Note in the following map that each of the nine parishes in the Rapides Foundation Service Area — including LaSalle Parish — is designated as a Medically Underserved Area/Population.

——

Health Professional Shortage Areas: Primary Care

Health Professional Shortage Area (HPSA) designations are approved by the federal Office of Shortage Designation (OSD) in the Health Resources and Services Administration (HRSA) located in Rockville, Maryland. Louisiana’s Bureau of Primary Care and Rural Health (BPCRH) typically submits requests pertaining to areas within the state. Designated HPSAs are valid for three years and are reviewed in the last year. Upon review, if the area continues to qualify, an updated request is submitted to OSD.

Several assistance programs use HPSA designations as a requirement when approving grants and other funding. These include J-1 Visa Waivers, National Health Service Corps Scholar and Loan Repayment Programs, Louisiana’s State Loan Repayment Program, the 10% Bonus Medicare Incentive Program (geographic HPSAs only), designating rural health clinics (RHCs) and federally qualified health centers (FQHCs), and several grants.

Primary Care designations pertain to an area’s access to physicians that practice principally in one of the following: family practice, general practice, internal medicine, pediatrics, and OB/GYN. A ratio is used to measure the level of primary care access. To be considered underserved a ratio of ≥3,500 possible patients to one (1) primary care
physician FTE (full-time equivalent) is usually required. The ratio is 3,000:1 for High Needs (High Needs is used if the 200% Federal Poverty Level for the area is over 20%). Provider FTEs are determined by taking the number of hours per week the physician spends in primary care services, either in-office or on-rounds at the hospital, divided by 40. The total of these FTEs is divided by the total resident/civilian population of the area.

For each of the three HPSA Designation types, there are three sub-categories, which include:

- **Geographic designations**—these take into account the entire population of the requested area to all available primary care physicians.

- **Population Group designations**—these are special groups. The most common of these are Low Income and Medicaid-Eligible designations. Low income designations use a ratio built upon the low income population of the area and the physicians providing services to this population. Medicaid-eligible designations are based on the number of Medicaid-eligible people and the physicians that accept Medicaid.

- **Facility designations**—these look at a facility’s outpatient census, waiting times, patients’ residences and in-house faculty to evaluate a facility’s designation eligibility.

LaSalle Parish is a geographically designated HPSA.
Vision Care

A total of 41.9% of LaSalle Parish adults have had an eye exam in the past two years during which their pupils were dilated.

- Lower than regional (RFSA) findings.
- Lower than national findings.
- Fluctuating over time showing no real trend.

Had an Eye Exam in the Past Two Years During Which the Pupils Were Dilated

Recent vision care is less often reported among:

- Young adults (note positive correlation with age).

Had an Eye Exam in the Past Two Years During Which the Pupils Were Dilated

(LaSalle Parish, 2013)
Dental Care

Adults

A total of 48.3% of LaSalle Parish adults have visited a dentist or dental clinic within the past year.

- Similar regional (RFSA) findings.
- Lower than found statewide.
- Lower than found nationally.
- Similar to the Healthy People 2020 goal (49.0% or higher).

Dental care in LaSalle Parish has remained statistically unchanged since 2002.

Have Visited a Dentist or Dental Clinic Within the Past Year

Recent dental care in the service area is less often reported among seniors and lower-income adults.

Sources:
- 2013 PRC Community Health Survey, Professional Research Consultants, Inc. (Item 22)
- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.
Children

A total of 85.2% of LaSalle Parish parents report that their child (age 2 to 17) has been to a dentist or dental clinic within the past year.

- Similar to regional (RFSA) findings.
- Similar to national findings.
- Satisfies the Healthy People 2020 goal (49.0% or higher).
- Statistically unchanged over time.
Health Professional Shortage Areas: Dental Care

Health Professional Shortage Area (HPSA) designations are approved by the federal Office of Shortage Designation (OSD) in the Health Resources and Services Administration (HRSA) located in Rockville, Maryland. Louisiana’s Bureau of Primary Care and Rural Health (BPCRH) typically submits requests pertaining to areas within the state. Designated HPSAs are valid for three years and are reviewed in the last year. Upon review, if the area continues to qualify, an updated request is submitted to OSD.

Dental designations (like primary care designations) are approved by the Shortage Designation Branch. These are designated on a similar ratio scheme. Dental FTEs are calculated by starting with the number of hours of patient care worked per week provided by the dentist. The FTE is then weighted according to the dentist’s age and number of in-house assistants the dentist employs. A ratio of ≥5,000 possible patients to one (1) dentist FTE is required or 4,000:1 for High Needs areas.

For each of the three HPSA Designation types, there are three sub-categories, which include:

- **Geographic designations**—these take into account the entire population of the requested area to all available dentists.
- **Population Group designations**—these are special groups. The most common of these are Low Income and Medicaid-Eligible designations. Low income designations use a ratio built upon the low income population of the area and the physicians providing services to this population. Medicaid-eligible designations are based on the number of Medicaid-eligible people and the physicians that accept Medicaid.
- **Facility designations**—these look at a facility’s outpatient census, waiting times, patients’ residences and in-house faculty to evaluate a facility’s designation eligibility.

LaSalle Parish is a geographically designated HPSA for dental care.
Healthcare Information Sources

According to survey data, family physicians and the Internet are residents’ primary sources of healthcare information.

- 50.4% of adults cited their **family physician** as their primary source of healthcare information.
- 18.0% of adults cited the **Internet** as their primary source of healthcare information.

**Primary Source of Healthcare Information**  
(LaSalle Parish, 2013)

- Family Doctor 50.4%
- Internet 18.0%
- Other 12.6%
- Friends/Relatives 6.1%
- Hospital Publications 6.4%
- Books/Magazines 2.6%
- Work 2.8%
- Don’t Receive Any 1.1%

**Sources:** 2013 PRC Community Health Survey, Professional Research Consultants, Inc. 
**Notes:** Asked of all respondents.
Emergency Room Services

A total of 9.0% of adults throughout LaSalle Parish have gone to a hospital emergency room more than once in the past year about their own health.

- Similar to the regional (RFSA) prevalence.
- Similar to the national prevalence.
- Marks a statistically significant improvement from baseline survey findings.

Have Used a Hospital Emergency Room More Than Once in the Past Year

Among those residents reporting recent use of the ER, 54.5% mentioned that it was an emergency situation, while 33.4% used the ER because it was a weekend or after-hours and 8.0% cited various access issues.

When asked why they used the ER instead of a doctor’s office, 54.5% say this was due to an emergency or life-threatening situation (lower than the 67.5% reported nationally), while 33.4% indicated that the visit was during after-hours or on the weekend (higher than the 17.9% across the US) and 8.0% cited some type of primary care access barrier (higher than the 6.2% nationally).

Note that multiple ER visits were most often noted among:

- Residents living at lower incomes.
Have Used a Hospital Emergency Room More Than Once in the Past Year
(LaSalle Parish, 2013)

Notes: Asked of all respondents.
Income categories reflect respondent’s household income as a ratio to the federal poverty level for their household size: very low income” = below poverty; “low income” = 100% to 200% of poverty; “middle/high income” = over 200% of poverty.
DEATH & DISABILITY
Leading Causes of Death

Distribution of Deaths by Cause

Together, cardiovascular disease (including both heart disease and stroke) and cancers accounted for well over one-half of all deaths in LaSalle Parish between 2008 and 2010.

- Note the higher proportion of LaSalle Parish deaths attributed to heart disease when compared to the state and especially the US overall.

The following chart shows crude mortality (death) rates by age groups in LaSalle Parish, in comparison with state and national rates. Crude death rates represent the number of deaths in relation to the population size (such as deaths per 100,000 population, as is used here).

- Compared to region, state and national rates, LaSalle Parish mortality rates among seniors are particularly higher.

- Infant deaths (under age 1) are lower compared to the region and state.
In addition, the following table provides a breakout of the top three leading causes of death by age group in the Rapides Foundation Service Area between 2008 and 2010 (note that this level of detail is not available at the parish level).

- Note that accidents are the leading cause of death in RFSA residents age 1 to 44; past age 44, cardiovascular disease (heart disease and stroke) emerge as the leading cause of death.

Sources: CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted July 2013.
Notes: Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10). Crude rates are not age-adjusted.
Age-Adjusted Death Rates: All Causes

In order to compare rates among localities (parish to parish, as well as against Louisiana and United States rates) without undue bias toward younger or older populations, the common convention is to adjust the data to some common baseline age distribution. Use of these “age-adjusted” rates provides the most valuable means of gauging mortality against benchmark data, as well as Healthy People 2020 targets.

**Between 2008-2010, there was an annual average of 989.2 age-adjusted deaths per 100,000 population.**

- Higher than the RFSA rate.
- Higher than the Louisiana rate.
- Well above the national mortality rate.

**All Causes: Age-Adjusted Mortality**

(2008-2010 Annual Average Deaths per 100,000 Population)

Viewed by race, the age-adjusted rate for all causes of death is similar among Blacks and Whites in LaSalle Parish (whereas it is higher among Blacks statewide and nationally).
All Causes: Age-Adjusted Mortality by Race
(2008-2010 Annual Average Deaths per 100,000 Population)

Sources: ● CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics.
Data extracted July 2013.
Notes: ● Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
● Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.

Note the overall decreasing trend in age-adjusted mortality for all causes in LaSalle Parish (with the most notable declines in the early to mid 2000s). This downward trend can also be seen statewide and nationally.

All Causes: Age-Adjusted Mortality Trends
(Annual Average Deaths per 100,000 Population)

Data extracted July 2013.
Notes: ● Deaths from 1999 forward are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10);
pre-1999 data were coded using ICD-9 coding.
● Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
● State and national data are simple three-year averages; the RFSA three-year average is weighted by population.
● NOTE: 2006-2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.

Age-Adjusted Death Rates for Selected Causes

The following chart outlines 2008-2010 annual average age-adjusted death rates per 100,000 population for selected causes of death in LaSalle Parish.

Note that, with the exception diabetes mellitus and Alzheimer’s disease deaths, LaSalle Parish death rates are worse than US rates for each of the selected causes.

LaSalle Parish death rates also fail to meet the available Healthy People 2020 objectives for all available targets.
### Age-Adjusted Death Rates for Selected Causes

### Years of Potential Life Lost (YPLL)

According to County Health Rankings (www.countyhealthrankings.org):

YPLL is a widely used measure of the rate and distribution of premature mortality. The measure was introduced mainly because simple mortality rates do not fully address the issue of premature death, the impact of disease and death, and their cost to society.

YPLL emphasizes deaths of younger persons, whereas statistics that include all mortality are dominated by deaths of the elderly. For example, using YPLL-75, a death at age 55 counts twice as much as a death at age 65, and a death at age 35 counts eight times as much as a death at age 70. Including all mortality instead of YPLL could draw attention to areas with higher mortality rates among the oldest segment of the population, where there may be little that can be done to change chronic health problems that have developed over many years.

YPLL is not without weaknesses. The measure can be difficult for lay people and public health practitioners to interpret. Further, deaths that occur after the age limit are not accounted for at all. Because of this, YPLL can fail to completely capture the burden of chronic disease, especially if the age cut-off is set too low.

In LaSalle Parish in 2008-2009, there was an age-adjusted rate of 9,264 years of potential life lost (before age 75) per 100,000 population.

- Similar to the statewide YPLL rate.
- Well above the national YPLL rate.
Years of Potential Life Lost (YPLL) Before Age 75
(2008-2009 Age-Adjusted Years per 100,000 Population)

LaSalle Parish | Louisiana | US Benchmark*
--- | --- | ---
9,264 | 9,555 | 5,317

Sources: ● National Center for Health Statistics and County Health Rankings: www.countyhealthrankings.org.
Notes: ● Premature death is represented by the years of potential life lost before age 75 (YPLL-75). Every death occurring before the age of 75 contributes to the total number of years of potential life lost. For example, a person dying at age 25 contributes 50 years of life lost, whereas a person who dies at age 65 contributes 10 years of life lost to a parish’s YPLL. The YPLL measure is presented as a rate per 100,000 population and is age-adjusted to the 2000 US population.
*US Benchmark is the 90th percentile among all US states.

Related Focus Group Findings: Chronic Disease

All participants agree that chronic disease conditions persist in the community, and that many of these are preventable. Focus group participants mentioned the following chronic health conditions which continue to affect the community: diabetes, hypertension, and obesity.
Cardiovascular Disease

Heart disease and stroke—the principal components of cardiovascular disease—are leading causes of death in the United States.

- About 950,000 adults die of heart disease or stroke each year, which amounts to one death every 33 seconds.
- Although heart disease and stroke are often thought to affect men and older people primarily, it is also a major killer of women and people in the prime of life. More than half of those who die of heart disease or stroke each year are women.
- Each year, about 63 of every 100,000 deaths are due to stroke.

Looking at only deaths due to heart disease or stroke, however, understates the health effects of these two conditions:

- About 61 million adults (almost one-fourth of the population) live with the effects of stroke or heart disease.
- Heart disease is a leading cause of disability among working adults.
- Stroke alone accounts for the disability of more than 1 million adults.
- Almost 6 million hospitalizations each year are due to heart disease or stroke.
- About 4.5 million stroke survivors are alive today.

The economic effects of heart disease and stroke on the US healthcare system grow larger as the population ages. In 2001, for example, the [nationwide] cost for all cardiovascular diseases was $300 billion: for heart disease the cost was $105 billion; for stroke, $28 billion. Lost productivity due to stroke and heart disease cost more than $129 billion.

– National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

Age-Adjusted Heart Disease & Stroke Deaths

Heart Disease Deaths

Between 2008 and 2010, there was an annual average age-adjusted heart disease mortality rate of 302.3 deaths per 100,000 population in LaSalle Parish.

- Higher than the regional rate.
- Higher than found statewide.
- Much higher than the national rate.
- Fails to satisfy the Healthy People 2020 objective (adjusted to account for all diseases of the heart).
Heart Disease: Age-Adjusted Mortality
(2008-2010 Annual Average Deaths per 100,000 Population)

Healthy People 2020 Target = 158.9 or Lower (Adjusted)

Sources: ● CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted July 2013.

Notes: ● Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
● Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
● The Healthy People 2020 Heart Disease target is adjusted to account for all diseases of the heart.
● NOTE: 2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.

Mortality rates have decreased across LaSalle Parish over time, echoing the decreasing trends across Louisiana and the US overall.

Heart Disease: Age-Adjusted Mortality Trends

Prevalence of Heart Disease

A total of 11.9% of area adults report that they suffer from or have been diagnosed with heart disease, such as coronary heart disease, angina or heart attack.

- Similar to regional findings.
- Worse than the national prevalence.

The prevalence of chronic heart disease in LaSalle Parish has remained statistically unchanged since the 2002 survey was conducted.

Prevalence of Heart Disease

![Bar chart showing prevalence of heart disease by location and year](chart-image)

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 158]
Notes: Asked of all respondents.

Adults more likely to have been diagnosed with chronic heart disease include:

- Older adults (note the strong positive correlation with age).

Prevalence of Heart Disease

(LaSalle Parish, 2013)

![Bar chart showing prevalence of heart disease by demographic](chart-image)

Sources: 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 158]
Notes: Asked of all respondents.

Income categories reflect respondent’s household income as a ratio to the federal poverty level for their household size: very low income” = below poverty; "low income” = 100% to 200% of poverty; “middle/high income” = over 200% of poverty.
Prevalence of Stroke

A total of 6.5% of surveyed adults report that they suffer from or have been diagnosed with cerebrovascular disease (a stroke).

- Similar to regional findings.
- Similar to statewide findings.
- Similar to national findings.

Statistically unchanged since 2002.

Note the stroke prevalence among LaSalle Parish seniors (9.2%), which is statistically similar to what is found among seniors nationwide.

Cardiovascular Risk Factors

Hypertension (High Blood Pressure)

High blood pressure is known as the “silent killer” and remains a major risk factor for coronary heart disease, stroke, and heart failure. About 50 million adults in the United States have high blood pressure.

High Blood Pressure Testing

A total of 98.6% of LaSalle Parish adults have had their blood pressure tested within the past two years.

- Higher than regional findings.
- Higher than national findings.
- Satisfies the Healthy People 2020 target.

Hypertension screening has remained statistically unchanged in LaSalle Parish over time.
Have Had Blood Pressure Checked in the Past 2 Years

Healthy People 2020 Target = 92.6% or Higher

Notes:
- Asked of all respondents.

Prevalence of Hypertension

A full 41.8% of adults have been told at some point that their blood pressure was high (an additional 3.0% have not been tested in the past five years).

- Similar to the RFSA prevalence.
- Similar to the Louisiana prevalence.
- Less favorable than the national prevalence.
- Far from satisfying the Healthy People 2020 target.
- Since 2002, the LaSalle Parish prevalence of hypertension has decreased significantly, though increased slightly in recent years.

Note that 80.8% of hypertensive residents have been diagnosed more than once.

Prevalence of High Blood Pressure

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Items 38, 159]
- 2013 PRC National Health Survey, Professional Research Consultants.

Notes:
- Asked of all respondents.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.
Hypertension diagnoses are higher among:

- Adults age 40 and older (note the very strong positive correlation with age).

### Prevalence of High Blood Pressure

#### (LaSalle Parish, 2013)

- **Men:** 37.1%
- **Women:** 46.9%
- **18 to 39:** 9.9%
- **40 to 64:** 55.3%
- **65+:** 73.4%
- **Very Low/Low Income:** 46.1%
- **Middle/High Income:** 37.0%
- **LaSalle Parish:** 41.8%

**Healthy People 2020 Target = 26.9% or Lower**

### Taking Action to Control Hypertension

#### (Among LaSalle Parish Adults with High BP, 2013)

- **LaSalle Parish:** 94.5%
- **RFSA:** 93.0%
- **United States:** 89.2%

### Sources:
- 2011 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 159]
- 2013 PRC National Health Survey, Professional Research Consultants.

### Notes:
- **Asked of all respondents.**
- Income categories reflect respondent's household income as a ratio to the federal poverty level for their household size: very low income" = below poverty; “low income" = 100% to 200% of poverty; “middle/high income" = over 200% of poverty.

### Hypertension Management

Among respondents who have been told that their blood pressure was high, 94.5% report that they are currently taking actions to control their condition, such as through medication, diet and/or exercise.

- Similar to regional findings.
- Higher than national findings.
- Over time, the prevalence of hypertensive adults in LaSalle Parish who are taking action to control their high blood pressure has improved.
High Blood Cholesterol

High blood cholesterol is a major risk factor for coronary heart disease that can be modified. More than 50 million US adults have blood cholesterol levels that require medical advice and treatment. More than 90 million adults have cholesterol levels that are higher than desirable. Experts recommend that all adults age 20 years and older have their cholesterol levels checked at least once every 5 years to help them take action to prevent or lower their risk of coronary heart disease. Lifestyle changes that prevent or lower high blood cholesterol include eating a diet low in saturated fat and cholesterol, increasing physical activity, and reducing excess weight.

Blood Cholesterol Testing

A total of 86.7% of LaSalle Parish adults have had their blood cholesterol checked within the past five years.

- Similar to regional findings.
- More favorable than Louisiana findings.
- Nearly the same as the national percentage.
- Satisfies the Healthy People 2020 target.

Since 2002, the prevalence of LaSalle Parish adults with recent cholesterol screenings has remained statistically unchanged.

The following demographic segments report a lower prevalence of recent cholesterol screenings:

- Residents with very low incomes.
Self-Reported High Blood Cholesterol

One-third (33.6%) of adults have been told by a health professional that their cholesterol level was high (an additional 18.7% have not had their cholesterol tested in the past five years).

- Similar to regional findings.
- Similar to Louisiana findings.
- Similar to the national prevalence.
- Far from satisfying the Healthy People 2020 target.
- Fluctuating over time showing no real trend.

Prevalence of High Blood Cholesterol

Healthy People 2020 Target = 13.5% or Lower

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. (Item 160)
- PRC National Health Survey, Professional Research Consultants.

Notes:
- Asked of all respondents.
- The Louisiana data reflects those adults who have been tested for high cholesterol and who have been diagnosed with it.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2012, state findings might not be directly comparable to the regional or national findings outlined in this report.
High blood cholesterol diagnoses are much higher among adults 40 and older.

**Taking Action to Control High Blood Cholesterol Levels**

(Among LaSalle Parish Adults with High Cholesterol, 2013)
Total Cardiovascular Risk

Individual level risk factors which put people at increased risk for cardiovascular diseases include:

- High Blood Pressure
- High Blood Cholesterol
- Tobacco Use
- Physical Inactivity
- Poor Nutrition
- Overweight/Obesity
- Diabetes

Three health-related behaviors contribute markedly to cardiovascular disease:

**Poor nutrition.** People who are overweight have a higher risk for cardiovascular disease. Almost 60% of adults are overweight or obese. To maintain a proper body weight, experts recommend a well-balanced diet which is low in fat and high in fiber, accompanied by regular exercise.

**Lack of physical activity.** People who are not physically active have twice the risk for heart disease of those who are active. More than half of adults do not achieve recommended levels of physical activity.

**Tobacco use.** Smokers have twice the risk for heart attack of nonsmokers. Nearly one-fifth of all deaths from cardiovascular disease, or about 190,000 deaths a year nationally, are smoking-related. Every day, more than 3,000 young people become daily smokers in the US.

Modifying these behaviors is critical both for preventing and for controlling cardiovascular disease. Other steps that adults who have cardiovascular disease should take to reduce their risk of death and disability include adhering to treatment for high blood pressure and cholesterol, using aspirin as appropriate, and learning the symptoms of heart attack and stroke.

A total of 89.2% of LaSalle Parish adults report one or more cardiovascular risk factors, such as being overweight, smoking cigarettes, being physically inactive, or having high blood pressure or cholesterol.

- Similar to regional findings.
- Less favorable than national findings.

Reports of one or more cardiovascular risk factor has decreased since the 2002 survey findings.

RELATED ISSUE:
See also Nutrition & Overweight, Physical Activity & Fitness and Tobacco Use in the Modifiable Health Risk section of this report.
Adults more likely to exhibit cardiovascular risk factors include:

- Men.
- Adults age 40 and older.
Cancer

Cancer, the second-leading cause of death among adults, is responsible for one of every four deaths in the United States. In 2003, over half a million adults—or more than 1,500 people a day—will die of cancer. Black adults are more likely to die from cancer than people of any other racial or ethnic group.

The financial costs of cancer are staggering. According to the National Institutes of Health, cancers cost the United States more than $170 billion in 2002. This includes more than $110 billion in lost productivity and over $60 billion in direct medical costs.

The number of new cancer cases can be reduced substantially, and many cancer deaths can be prevented. Healthier lifestyles can significantly reduce a person’s risk for cancer—for example, avoiding tobacco use, increasing physical activity, improving nutrition, and avoiding sun exposure. Making cancer screening and information services available and accessible to all adults is also essential for reducing the high rates of cancer and cancer deaths. Screening tests for breast, cervical, and colorectal cancers reduce the number of deaths from these diseases by finding them early, when they are most treatable. Screening tests for cervical and colorectal cancers can actually prevent these cancers from developing by detecting treatable precancerous conditions.

— National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

Age-Adjusted Cancer Deaths

All Cancer Deaths

*Between 2008 and 2010, there was an annual average age-adjusted cancer mortality rate of 215.5 deaths per 100,000 population in LaSalle Parish.*

- Higher than the rate found for the RFSA.
- Higher than the rate reported across Louisiana.
- Less favorable than the national rate.
- Far from satisfying the Health People 2020 target.
Cancer mortality rates have increased over the past several years.

### Cancer Deaths by Site

#### LUNG CANCER

Lung cancer is the most common cause of cancer death among both females and males in the United States. Cigarette smoking is the most important risk factor for lung cancer, accounting for 68 to 78 percent of lung cancer deaths among females and 88 to 91 percent of lung cancer deaths among males. Other risk factors include occupational exposures (radon, asbestos) and indoor and outdoor air pollution (radon, environmental tobacco smoke). One to two percent of lung cancer deaths are attributable to air pollution. After 10 years of abstinence, smoking cessation decreases the risk of lung cancer to 30 to 50 percent of that of continuing smokers.

Lung cancer is by far the leading cause of cancer deaths in LaSalle Parish.

Other leading sites include prostate cancer in men, breast cancer in women, and colorectal cancer (both genders).

As can be seen in the following chart (referencing 2001-2010 annual average age-adjusted death rates):

- LaSalle Parish death rates are higher than regional, state and national rates for each cancer site.

Note that none of these LaSalle Parish rates satisfies the related Healthy People 2020 objectives.
Prevalence of Cancer

A total of 9.1% of surveyed LaSalle Parish adults report having been diagnosed with some type of cancer.

- Similar to regional findings.
- The prevalence of cancer in LaSalle Parish has remained statistically unchanged since the 2002 survey was conducted.

Cancer Risk

Reducing the nation’s cancer burden requires reducing the prevalence of behavioral and environmental factors that increase cancer risk.

- All cancers caused by cigarette smoking could be prevented. At least one-third of cancer deaths that occur in the United States are due to cigarette smoking.
- According to the American Cancer Society, about one-third of cancer deaths that occur in the United States each year are due to nutrition and physical activity factors, including obesity.

Related issue: See also Nutrition & Overweight, Physical Activity & Fitness and Tobacco Use in the Modifiable Health Risk section of this report.
Cancer Screenings

The American Cancer Society recommends that both men and women get a cancer-related checkup during a regular doctor's checkup. It should include examination for cancers of the thyroid, testicles, ovaries, lymph nodes, oral cavity, and skin, as well as health counseling about tobacco, sun exposure, diet and nutrition, risk factors, sexual practices, and environmental and occupational exposures.

Screening levels in the community were measured in the 2013 Community Health Survey relative to four cancer sites: prostate cancer (prostate-specific antigen testing and digital rectal examination); female breast cancer (mammography); cervical cancer (Pap smear testing); and colorectal cancer (sigmoidoscopy and fecal occult blood testing).

Prostate Cancer Screenings

PROSTATE CANCER

Prostate cancer is the most commonly diagnosed form of cancer (other than skin cancer) in males and the second leading cause of cancer death among males in the United States. Prostate cancer is most common in men age 65 years and older, who account for approximately 80 percent of all cases of prostate cancer.

Digital rectal examination (DRE) and the prostate-specific antigen (PSA) test are two commonly used methods for detecting prostate cancer. Although several treatment alternatives are available for prostate cancer, their impact on reducing death from prostate cancer when compared with no treatment in patients with operable cancer is uncertain. Efforts aimed at reducing deaths through screening and early detection remain controversial because of the uncertain benefits and potential risks of screening, diagnosis, and treatment.

The US Preventive Services Task Force (USPSTF) concludes that the current evidence is insufficient to assess the balance of benefits and harms of prostate cancer screening in men younger than age 75 years.

Rationale: Prostate cancer is the most common nonskin cancer and the second-leading cause of cancer death in men in the United States. The USPSTF found convincing evidence that prostate-specific antigen (PSA) screening can detect some cases of prostate cancer.

In men younger than age 75 years, the USPSTF found inadequate evidence to determine whether treatment for prostate cancer detected by screening improves health outcomes compared with treatment after clinical detection.

The USPSTF found convincing evidence that treatment for prostate cancer detected by screening causes moderate-to-substantial harms, such as erectile dysfunction, urinary incontinence, bowel dysfunction, and death. These harms are especially important because some men with prostate cancer who are treated would never have developed symptoms related to cancer during their lifetime.

There is also adequate evidence that the screening process produces at least small harms, including pain and discomfort associated with prostate biopsy and psychological effects of false-positive test results.

The USPSTF recommends against screening for prostate cancer in men age 75 years or older.

Rationale: In men age 75 years or older, the USPSTF found adequate evidence that the incremental benefits of treatment for prostate cancer detected by screening are small to none.

Given the uncertainties and controversy surrounding prostate cancer screening in men younger than age 75 years, a clinician should not order the PSA test without first discussing with the patient the potential but uncertain benefits and the known harms of prostate cancer screening and treatment. Men should be informed of the gaps in the evidence and should be assisted in considering their personal preferences before deciding whether to be tested.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.
PSA Testing and/or Digital Rectal Examination

Among men age 50 and older, nearly three in four (69.9%) have had a PSA (prostate-specific antigen) test and/or a digital rectal examination for prostate problems within the past two years.

- Similar to regional findings.
- Comparable to national findings.
- Statistically unchanged over time.

Have Had a Prostate Screening in the Past 2 Years
(Among LaSalle Parish Men 50+, 2013)

Female Breast Cancer Screening

FEMALE BREAST CANCER

Breast cancer is the most common cancer [diagnosis] among women in the United States. Death from breast cancer can be reduced substantially if the tumor is discovered at an early stage. Mammography is the most effective method for detecting these early malignancies. Clinical trials have demonstrated that mammography screening can reduce breast cancer deaths by 20 to 39 percent in women age 50 to 74 years and about 17 percent in women age 40 to 49 years. Breast cancer deaths can be reduced through increased adherence with recommendations for regular mammography screening.

Many breast cancer risk factors, such as age, family history of breast cancer, reproductive history, mammographic densities, previous breast disease, and race and ethnicity, are not subject to intervention. However, being overweight is a well-established breast cancer risk for postmenopausal women that can be addressed. Avoiding weight gain is one method by which older women may reduce their risk of developing breast cancer.

The US Preventive Services Task Force (USPSTF) recommends screening mammography, with or without clinical breast examination (CBE), every 1-2 years for women age 40 and older.

Rationale: The USPSTF found fair evidence that mammography screening every 12-33 months significantly reduces mortality from breast cancer. Evidence is strongest for women age 50-69, the age group generally included in screening trials. For women age 40-49, the evidence that screening mammography reduces mortality from breast cancer is weaker, and the absolute benefit of mammography is smaller, than it is for older women. Most, but not all, studies indicate a mortality benefit for women undergoing mammography at ages 40-49, but the delay in observed benefit in women younger than 50 makes it difficult to determine the incremental benefit of beginning screening at age 40 rather than at age 50.
The absolute benefit is smaller because the incidence of breast cancer is lower among women in their 40s than it is among older women. The USPSTF concluded that the evidence is also generalizable to women age 70 and older (who face a higher absolute risk for breast cancer) if their life expectancy is not compromised by comorbid disease. The absolute probability of benefits of regular mammography increase along a continuum with age, whereas the likelihood of harms from screening (false-positive results and unnecessary anxiety, biopsies, and cost) diminish from ages 40-70. The balance of benefits and potential harms, therefore, grows more favorable as women age. The precise age at which the potential benefits of mammography justify the possible harms is a subjective choice. The USPSTF did not find sufficient evidence to specify the optimal screening interval for women age 40-49.

US Preventive Services Task Force, Agency for Healthcare Research and Quality, US Department of Health & Human Services. Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.

Mammography

Among women **age 50 to 74**, 71.0% have had a mammogram within the past two years.

- Similar to regional findings.
- Similar to the statewide figure (which represents all women 50 and older).
- Lower than national findings.
- Fails to satisfy the Healthy People 2020 target.

Since 2002, the prevalence of LaSalle Parish women age 50 to 74 who received a mammogram in the past two years has remained unchanged.

Have Had a Mammogram in the Past Two Years

(Among LaSalle Parish Women Age 50-74, 2013)

Among women **40 and older**, 70.7% had a mammogram in the past two years.
Cervical Cancer Screenings

CERVICAL CANCER

The US Preventive Services Task Force (USPSTF) strongly recommends screening for cervical cancer in women who have been sexually active and have a cervix.

Rationale: The USPSTF found good evidence from multiple observational studies that screening with cervical cytology (Pap smears) reduces incidence of and mortality from cervical cancer. Direct evidence to determine the optimal starting and stopping age and interval for screening is limited. Indirect evidence suggests most of the benefit can be obtained by beginning screening within 3 years of onset of sexual activity or age 21 (whichever comes first) and screening at least every 3 years. The USPSTF concludes that the benefits of screening substantially outweigh potential harms.

The USPSTF recommends against routinely screening women older than age 65 for cervical cancer if they have had adequate recent screening with normal Pap smears and are not otherwise at high risk for cervical cancer.

Rationale: The USPSTF found limited evidence to determine the benefits of continued screening in women older than 65. The yield of screening is low in previously screened women older than 65 due to the declining incidence of high-grade cervical lesions after middle age. There is fair evidence that screening women older than 65 is associated with an increased risk for potential harms, including false-positive results and invasive procedures. The USPSTF concludes that the potential harms of screening are likely to exceed benefits among older women who have had normal results previously and who are not otherwise at high risk for cervical cancer.

The USPSTF recommends against routine Pap smear screening in women who have had a total hysterectomy for benign disease.

Rationale: The USPSTF found fair evidence that the yield of cytologic screening is very low in women after hysterectomy and poor evidence that screening to detect vaginal cancer improves health outcomes. The USPSTF concludes that potential harms of continued screening after hysterectomy are likely to exceed benefits.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.
Pap Smear Testing

Among women age 21 to 65, 76.8% have had a Pap smear within the past three years.

- Similar to regional findings.
- Similar to the Louisiana percentage, which represents all women 18+.
- Similar to national findings.
- Fails to satisfy the Healthy People 2020 target.
- Statistically unchanged over time.

Have Had a Pap Smear in the Past 3 Years
(Among LaSalle Parish Women Age 21-65, 2013)

Among women age 18 and older, 69.9% had a Pap smear in the past three years.
Colorectal Cancer Screenings

COLORECTAL CANCER

Colorectal cancer is the third most common type of cancer and the second leading cause of cancer death in the United States. Current levels of screening in this country lag behind those of other effective cancer screening tests; it has been estimated that attainment of goals for population colorectal cancer screening could save 18,800 lives per year. Colorectal cancer incidence and mortality show health disparities, with a disproportionate burden occurring in certain minority populations, including African American adults and Alaska Natives.

The USPSTF recommends screening for colorectal cancer using fecal occult blood testing, sigmoidoscopy, or colonoscopy in adults, beginning at age 50 years and continuing until age 75 years.

The evidence is convincing that screening for colorectal cancer with fecal occult blood testing, sigmoidoscopy, or colonoscopy detects early-stage cancer and adenomatous polyps. There is convincing evidence that screening with any of the three recommended tests (FOBT, sigmoidoscopy, colonoscopy) reduces colorectal cancer mortality in adults age 50 to 75 years. Follow-up of positive screening test results requires colonoscopy regardless of the screening test used.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.

Risk factors for colorectal cancer may include age, personal and family history of polyps or colorectal cancer, inflammatory bowel disease, inherited syndromes, physical inactivity (colon only), obesity, alcohol use, and a diet high in fat and low in fruits and vegetables. Detecting and removing precancerous colorectal polyps and detecting and treating the disease in its earliest stages will reduce deaths from colorectal cancer.

Colorectal Cancer Screening

Among LaSalle Parish adults age 50-75, two-thirds (67.7%) have had an appropriate colorectal cancer screening (fecal occult blood testing within the past year and/or sigmoidoscopy/colonoscopy [lower endoscopy] within the past 10 years).

- Similar to regional (RFSA) findings.
- Similar to the national prevalence.
- Similar to the Healthy People 2020 target.

Have Had a Colorectal Cancer Screening
(Among Adults Age 50-75)

Healthy People 2020 Target = 70.5% or Higher

Sources: ● 2010 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 166]
Notes: ● Asked of all respondents age 50 through 75.
 ● In this case, the term "colorectal screening" refers to adults age 50-75 receiving a FOBT (fecal occult blood test) in the past year and/or a lower endoscopy (sigmoidoscopy/colonoscopy) in the past 10 years.
Sigmoidoscopy/Colonoscopy

Among adults age 50 and older, 68.2% have had a sigmoidoscopy or colonoscopy at some point in their lives.

- Similar to regional (RFSA) findings.
- More favorable than Louisiana findings.
- Comparable to the national figure.

The LaSalle Parish prevalence of sigmoidoscopy/colonoscopy has increased significantly since 2002.

**Have Ever Had a Lower Endoscopy Exam**
(Among LaSalle Parish Adults 50+, 2013)

Sources: ● PRC Community Health Surveys, Professional Research Consultants, Inc. (Item 166)
● 2013 PRC National Health Survey, Professional Research Consultants.

Notes: ● Asked of all respondents 50+.
● Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.

Blood Stool Testing

Among adults age 50 and older, 26.7% have had a blood stool test (aka “fecal occult blood test”) within the past two years.

- Similar to regional (RFSA) findings.
- More favorable than Louisiana findings.
- Less favorable than national findings.

Since 2002, the prevalence of recent blood stool exams has decreased significantly.
Have Had a Blood Stool Test in the Past 2 Years
(Among LaSalle Parish Adults 50+, 2013)

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. (Item 167)
- 2013 PRC National Health Survey, Professional Research Consultants.

Notes:
- Asked of all respondents 50+.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.
Respiratory Disease

Asthma and COPD (chronic obstructive pulmonary disease) are among the 10 leading chronic conditions causing restricted activity [in adults]. After chronic sinusitis, asthma is the most common cause of chronic illness in children. Methods are available to treat these respiratory diseases and promote respiratory health.

Asthma is a serious and growing health problem. An estimated 14.9 million persons in the United States have asthma. Asthma is responsible for about 500,000 hospitalizations, 5,000 deaths, and 134 million days of restricted activity a year. Yet most of the problems caused by asthma could be averted if persons with asthma and their healthcare providers managed the disease according to established guidelines.

COPD includes chronic bronchitis and emphysema—both of which are characterized by irreversible airflow obstruction and often exist together. Similar to asthma, COPD may be accompanied by an airway hyperresponsiveness. Most patients with COPD have a history of cigarette smoking. COPD worsens over time with continued exposure to a causative agent—usually tobacco smoke or sometimes a substance in the workplace or environment. COPD occurs most often in older people.

Age-Adjusted Respiratory Disease Deaths

Chronic Lower Respiratory Disease Deaths (CLRD)

Between 2008 and 2010, there was an annual average age-adjusted CLRD mortality rate of 52.1 deaths per 100,000 population in LaSalle Parish.

- Higher than the regional (RFSA) rate.
- Higher than found statewide.
- Higher than the national rate.

CLRD: Age-Adjusted Mortality
(2008-2010* Annual Average Deaths per 100,000 Population)

Sources: ● CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted July 2013.

Notes: ● Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
● Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
● CLRD is chronic lower respiratory disease.
● * Due to low numbers of deaths: the rate for LaSalle Parish represents 2006-2010 data.
● NOTE: 2006-2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.

Note: What was previously termed COPD (chronic obstructive pulmonary disease) has been reclassified as CLRD (chronic lower respiratory disease).
Pneumonia/Influenza Deaths

Between 2008 and 2010, there was an annual average age-adjusted pneumonia/influenza mortality rate of 32.5 deaths per 100,000 population in LaSalle Parish.

- Higher than the RFSA rate.
- Higher than found statewide.
- Much higher than the national rate.

Pneumonia/Influenza: Age-Adjusted Mortality

(2008-2010* Annual Average Deaths per 100,000 Population)

Notes:
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
- *Due to low counts, the LaSalle Parish rate represents 2006-2010 data.
- NOTE: 2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.

Prevalence of Asthma

Adults

A total of 7.8% of LaSalle Parish adults currently suffer from asthma.

- Similar to regional (RFSA) findings.
- Comparable to the percentage reported across the state.
- Similar to the percentage reported across the nation.
- Statistically unchanged over time.
Currently Have Asthma

Sources:
- 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 169]
- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.

The following adults are more likely to suffer from asthma:

- Women.
- Lower-income residents.

Currently Have Asthma
(LaSalle Parish, 2013)

- 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 169]

Notes:
- Asked of all respondents.
- Income categories reflect respondent's household income as a ratio to the federal poverty level for their household size. "Very low income" = below poverty, "low income" = 100% to 200% of poverty, "middle/high income" = over 200% of poverty.
Children

A total of 8.8% of LaSalle Parish children currently suffer from asthma.

- Similar to regional (RFSA) findings.
- Comparable to the percentage reported across the nation.
- The percentage of children who have ever been diagnosed with asthma is statistically unchanged over time.

Child Currently Has Asthma
(LaSalle Parish Parents of Children <18, 2013)

Prevalence of Chronic Lung Disease

A total of 15.8% of surveyed adults report suffering from chronic lung disease.

- Similar to regional (RFSA) findings.
- Higher than the state prevalence.
- Higher than the percentage reported across the nation.
- Statistically unchanged since 2002.
Injury & Violence

The risk of injury is so great that most persons sustain a significant injury at some time during their lives. Nevertheless, this widespread human damage too often is taken for granted, in the erroneous belief that injuries happen by chance and are the result of unpreventable “accidents.” In fact, many injuries are not “accidents,” or random, uncontrolable acts of fate; rather, most injuries are predictable and preventable.

For ages 1 through 44 years, [US] deaths from injuries far surpass those from cancer—the overall leading natural cause of death at these ages—by about three to one. Injuries cause more than two out of five deaths (43 percent) of children age 1 through 4 years and result in four times the number of deaths due to birth defects, the second leading cause of death for this age group. For ages 15 to 24 years, injury deaths exceed deaths from all other causes combined from ages 5 through 44 years. For ages 15 to 24 years, injuries are the cause of nearly four out of five deaths. After age 44 years, injuries account for fewer deaths than other health problems, such as heart disease, cancer, and stroke. However, despite the decrease in the proportion of deaths due to injury, the death rate from injuries is actually higher among older persons than among younger persons.

Leading Causes of Accidental Death

Motor vehicle accidents accounted for more than 42% of accidental LaSalle Parish deaths between 2006 and 2010. Poisoning (including accidental drug overdoses) ranked as the second leading cause of accidental death.

Unintentional Injury

Age-Adjusted Unintentional Injury Deaths

Between 2008 and 2010, there was an annual average age-adjusted unintentional injury mortality rate of 62.8 deaths per 100,000 population in LaSalle Parish.

- Worse than the regional rate.
- Worse than the state rate.
- Worse than the US rate.
- Fails to satisfy the Health People 2020 target.

Unintentional Injuries: Age-Adjusted Mortality
(2008-2010 Annual Average Deaths per 100,000 Population)

The LaSalle Parish unintentional injury mortality rate increased significantly from baseline 2001-2003 findings.

- NOTE: 2006-2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.

Violent Crime

Self-Reported Violence

A total of 1.2% of LaSalle Parish adults acknowledge being the victim of a violent crime in the past five years.

- Comparable to the regional prevalence.
- More favorable than the national prevalence.
- The prevalence of residents who have been victims of a violent crime in the past 5 years has remained stable.
Reports of violence are notably higher among women.

Victim of a Violent Crime in the Past 5 Years

(LaSalle Parish, 2013)
Family Violence

A total of 14.9% of LaSalle Parish adults acknowledge that they have ever been hit, slapped, pushed, kicked, or otherwise hurt by an intimate partner.

- Comparable to the regional prevalence.
- Comparable to national findings.
- Statistically unchanged since 2010 survey results.

Have Ever Been Hit, Slapped, Pushed, Kicked, or Hurt in Any Way by an Intimate Partner

Reports of domestic violence are notably higher among:

- Women.
- Adults under age 65 (note the negative correlation with age).

Diabetes

Diabetes affects nearly 16 million adults and contributes to about 200,000 deaths a year. Diabetes can cause heart disease, stroke, blindness, kidney failure, leg and foot amputations, pregnancy complications, and deaths related to influenza and pneumonia. About 5.4 million adults are unaware they have the disease.

Among adults, diagnosed diabetes (including gestational diabetes) increased 49% from 1990 to 2000. The largest increase was among people age 30–39. Type 2 affects 90%–95% of people with diabetes and is linked to obesity and physical inactivity.

The direct and indirect costs of diabetes in America are nearly $100 billion a year.

- National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

Age-Adjusted Diabetes Mellitus Deaths

Between 2008 and 2010, there was an annual average age-adjusted diabetes mortality rate of 21.9 deaths per 100,000 population in LaSalle Parish.

- More favorable than the regional rate.
- More favorable than the Louisiana rate.
- Similar to the national rate.
- Fails to satisfy the Health People 2020 target.

Arthritis & Rheumatism

The current and projected growth in the number of people age 65 years and older in the United States has focused attention on preserving quality of life, as well as length of life. Chief among the factors involving preserving quality of life are the prevention and treatment of musculoskeletal conditions—the major causes of disability in the United States. Among musculoskeletal conditions, arthritis and other rheumatic conditions, osteoporosis, and chronic back conditions have the greatest impact on public health and quality of life.

More than one in four LaSalle Parish adults (27.9%) report suffering from arthritis or rheumatism.

- Similar to what is found regionally.
- Less favorable than that found nationwide.
- The prevalence of arthritis/rheumatism in LaSalle Parish has decreased significantly over time.
- Among LaSalle Parish adults age 50 and older, 43.9% have arthritis or rheumatism (comparable to the regional and national prevalence).

**Prevalence of Arthritis/Rheumatism**

Notes:● Asked of all respondents.
MODIFIABLE HEALTH RISK BEHAVIORS
A 2002 study (an update to a landmark 1993 study), estimated that as many as 40% of premature deaths in the United States are attributed to behavioral factors. This study found that behavior patterns represent the single-most prominent domain of influence over health prospects in the United States. The daily choices we make with respect to diet, physical activity, and sex; the substance abuse and addictions to which we fall prey; our approach to safety; and our coping strategies in confronting stress are all important determinants of health.

The most prominent contributors to mortality in the United States in 2000 were tobacco (an estimated 435,000 deaths), diet and activity patterns (400,000), alcohol (85,000), microbial agents (75,000), toxic agents (55,000), motor vehicles (43,000), firearms (29,000), sexual behavior (20,000), and illicit use of drugs (17,000). Socioeconomic status and access to medical care are also important contributors, but difficult to quantify independent of the other factors cited. Because the studies reviewed used different approaches to derive estimates, the stated numbers should be viewed as first approximations.

These analyses show that smoking remains the leading cause of mortality. However, poor diet and physical inactivity may soon overtake tobacco as the leading cause of death. These findings, along with escalating healthcare costs and aging population, argue persuasively that the need to establish a more preventive orientation in the US healthcare and public health systems has become more urgent.

While causes of death are typically described as the diseases or injuries immediately precipitating the end of life, a few important studies have shown that the actual causes of premature death (reflecting underlying risk factors) are often preventable.
To measure food and beverage consumption, survey respondents were asked specifically about the foods and drinks they consumed on the day prior to the interview.

**Nutrition**

**Adults**

**Daily Recommendation of Fruits/Vegetables**

A total of 31.9% of area adults report eating five or more servings of fruits and/or vegetables per day.

- Comparable to regional findings.
- Lower than national findings.
- Statistically unchanged since 2002.

**Consume Five or More Servings of Fruits/Vegetables Per Day**

Body Weight

Body Mass Index (BMI), which describes relative weight for height, is significantly correlated with total body fat content. The BMI should be used to assess overweight and obesity and to monitor changes in body weight. In addition, measurements of body weight alone can be used to determine efficacy of weight loss therapy. BMI is calculated as weight (kg)/height squared (m$^2$). To estimate BMI using pounds and inches, use: \[\text{BMI} = \left(\frac{\text{weight (pounds)}}{\text{height (inches)}^2}\right) \times 703.\]

In this report, overweight is defined as a BMI of 25.0 to 29.9 kg/m$^2$ and obesity as a BMI of $\geq$30 kg/m$^2$. The rationale behind these definitions is based on epidemiological data that show increases in mortality with BMIs above 25 kg/m$^2$. The increase in mortality, however, tends to be modest until a BMI of 30 kg/m$^2$ is reached. For persons with a BMI of $\geq$30 kg/m$^2$, mortality rates from all causes, and especially from cardiovascular disease, are generally increased by 50 to 100 percent above that of persons with BMIs in the range of 20 to 25 kg/m$^2$.

Overweight and obesity result from a complex interaction between genes and the environment characterized by long-term energy imbalance due to a sedentary lifestyle, excessive caloric consumption, or both. They develop in a socio-cultural environment characterized by mechanization, sedentary lifestyle, and ready access to abundant food. Attempts to prevent overweight and obesity are difficult to both study and achieve.

Healthy Weight

Based on self-reported heights and weights, only 29.9% of LaSalle Parish adults are at a healthy weight (neither underweight nor overweight, BMI = 18.5-24.9).

- Similar to the regional (RFSA) percentage.
- Similar to the Louisiana percentage.
- Similar to national findings.
- Similar to the Healthy People 2020 target.
- Statistically unchanged over time.
Healthy Weight
(Body Mass Index Between 18.5 and 24.9)

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 196]
- 2011 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Based on reported heights and weights, asked of all respondents.
- The definition of healthy weight is having a body mass index (BMI), a ratio of weight to height (kilograms divided by meters squared), between 18.5 and 24.9.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.

Overweight Status
Adults

Based on self-reported heights and weights, 69.3% of LaSalle Parish adults are overweight or obese (BMI ≥25).

- Similar to the regional prevalence.
- Similar to the Louisiana prevalence.
- Higher than the US prevalence.
- Statistically unchanged since 2002.

Prevalence of Total Overweight
(Overweight or/Obese Adults; Body Mass Index of 25.0 or Higher)

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 196]
- 2011 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Based on reported heights and weights, asked of all respondents.
- The definition of overweight is having a body mass index (BMI), a ratio of weight to height (kilograms divided by meters squared), greater than or equal to 25.0, regardless of gender. The definition for obesity is a BMI greater than or equal to 30.0.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.
Specifically, 39.5% of LaSalle Parish adults are obese (BMI ≥ 30, also included in overweight prevalence discussed previously).

- Similar to the regional prevalence.
- Less favorable than the Louisiana percentage.
- Less favorable than US findings.
- Fails to satisfy the Healthy People 2020 target.
- Marks a statistically significant increase in obesity over time.

Weight Management

Health Advice About Weight Management

A total of 27.2% of adults have been given advice about their weight by a doctor, nurse or other health professional in the past year.

- Comparable to regional findings.
- Comparable to the national findings.
- Marks a significant increase since 2005.
- Note that 45.9% of obese adults have been given advice about their weight by a health professional in the past year (while over one-half has not).

![Have Received Advice About Weight in the Past Year](chart)

Weight Control

Many diseases are associated with overweight and obesity. Persons who are overweight or obese are at increased risk for high blood pressure, type 2 diabetes, coronary heart disease, stroke, gallbladder disease, osteoarthritis, sleep apnea, respiratory problems, and some types of cancer. The health outcomes related to these diseases, however, often can be improved through weight loss or, at a minimum, no further weight gain.

A total of 36.6% of LaSalle Parish adults who are overweight or obese say that they are both modifying their diet and increasing their physical activity to try to lose weight.

- Similar to the regional prevalence among overweight or obese adults.
- Similar to the national percentage among overweight or obese adults.
- Note: 42.7% of LaSalle Parish adults who are obese report that they are trying to lose weight through a combination of diet and exercise, compared to 47.4% across the nation.
The proportion of overweight and obese adults in LaSalle Parish who are using diet and exercise to try to lose weight has improved over time.

**Relationship of Overweight With Other Health Issues**

Overweight and obese adults are more likely to report a number of adverse health conditions.

These include:

- Hypertension (high blood pressure).
- High cholesterol.
- Fair/poor overall health.
- Diabetes.

Notes:
- Based on reported heights and weights, asked of all respondents.

Childhood Overweight & Obesity

In children and teens, body mass index (BMI) is used to assess weight status – underweight, healthy weight, overweight, or obese. After BMI is calculated for children and teens, the BMI number is plotted on the CDC BMI-for-age growth charts (for either girls or boys) to obtain a percentile ranking. Percentiles are the most commonly used indicator to assess the size and growth patterns of individual children in the United States. The percentile indicates the relative position of the child’s BMI number among children of the same sex and age.

BMI-for-age weight status categories and the corresponding percentiles are shown below:

- Underweight < 5th percentile
- Healthy Weight ≥ 5th and < 85th percentile
- Overweight ≥ 85th and < 95th percentile
- Obese ≥ 95th percentile

Centers for Disease Control and Prevention.

Based on the heights/weights reported by surveyed parents, 41.4% of Lasalle Parish children age 6 to 17 are overweight or obese (≥ 85th percentile).

- Similar to the regional prevalence.
- Similar to the prevalence reported nationally.

In Lasalle Parish, overall childhood overweight/obesity is lower than what was reported in 2005, but the difference is not statistically significant.
Specifically, 32.5% of area children age 6 to 17 are obese (≥95th percentile).

- Similar to the regional prevalence.
- Higher than the national percentage.
- Fails to satisfy the Healthy People 2020 target.

Childhood obesity is higher than what was first reported in 2005, but the difference is not statistically significant.
Notification of Child’s Weight Status

A total of 2.8% of LaSalle Parish parents report that, within the past year, a health professional or someone at their child’s school has told them that their child was overweight.

Have Been Told by a Health Professional or Someone at Child’s School in the Past Year That Child Is Overweight

(LaSalle Parish Parents of Children <18, 2013)

Sources: ● 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 145]
            ● 2013 PRC National Health Survey, Professional Research Consultants.
Notes: ● Asked of all respondents with children under 18 at home.

Related Focus Group Findings: Nutrition and Obesity

Many focus group participants discussed nutrition and obesity. The main findings include:

- Poor nutrition
- Cultural traditions
- Fast food establishments

Participants believe that residents have poor nutrition which contributes to the high prevalence of obesity in the community and diabetes. Attendees feel that Southern cultural traditions influence the level of obesity in the community due to the poor diet and prevalence of fried foods. A participant explains:

"Just learning to bake and broil instead of deep fry fish. Just the old southern traditions. Southerners love fried food and they love butter. And, gravy. So, it's hard to break that paradigm, isn't it?" — LaSalle Parish Key Informant

In addition, poor eating habits represent the new norm for the younger generations because fast food establishments represent the convenient, easy option. A respondent explains the different eating habits between him and his children.

"My wife (and I), at least five nights a week we have a home cooked supper. I mean, from time to time we will eat a convenience food. Something pre-prepared. Just we're late getting home, stick it in the oven, and warm it up a little bit... But, my kids — I mean, gosh. They never cook at home. My older daughter never cooks at home. You know, it's a pre-packaged meal, or go through the drive through and they get the 99-cent heart attack." — LaSalle Parish Key Informant
Even though many residents possess poor eating habits, the two mayors in LaSalle Parish are working to improve access to fresh fruits and vegetables through the creation of community gardens and weekly Farmer’s Markets:

“We’re having a Farmer’s Market, as well as the mayor on the other end of town – he’s working on a Farmer’s Market. And, we’re cultivating some of these truck farmers that grow for themselves – encouraging them to plant two or three more acres and make that available through the grocery store sales, as well as setting up a stand. We’re making that space available to them to do that and then we’ll help them advertise.” — LaSalle Parish Key Informant
Physical Activity & Fitness

The 1990s brought a historic new perspective to exercise, fitness, and physical activity by shifting the focus from intensive vigorous exercise to a broader range of health-enhancing physical activities. Research has demonstrated that virtually all individuals will benefit from regular physical activity. A Surgeon General’s report on physical activity and health concluded that moderate physical activity can reduce substantially the risk of developing or dying from heart disease, diabetes, colon cancer, and high blood pressure. Physical activity also may protect against lower back pain and some forms of cancer (for example, breast cancer), but the evidence is not yet conclusive.

On average, physically active people outlive those who are inactive. Regular physical activity also helps to maintain the functional independence of older adults and enhances the quality of life for people of all ages.

The role of physical activity in preventing coronary heart disease (CHD) is of particular importance, given that CHD is the leading cause of death and disability in the United States. Physically inactive people are almost twice as likely to develop CHD as persons who engage in regular physical activity. The risk posed by physical inactivity is almost as high as several well-known CHD risk factors, such as cigarette smoking, high blood pressure, and high blood cholesterol. Physical inactivity, though, is more prevalent than any one of these other risk factors. People with other risk factors for CHD, such as obesity and high blood pressure, may particularly benefit from physical activity.

Adults’ Physical Activity

Level of Activity at Work

A majority of employed respondents reports low levels of physical activity at work.

- A total of 70.8% of employed respondents reports that their job entails mostly sitting or standing, a higher percentage than found nationally.
- 17.2% report that their job entails mostly walking (lower than the percentage reported nationally).
- 12.0% report that their work is physically demanding (similar to the US figure).

The percentage of employed respondents who report that their job entails mostly sitting or standing is significantly higher than the baseline 2005 findings (not shown).

Notes: Asked of those respondents who are employed for wages.
Leisure-Time Physical Activity

Effects of Physical Inactivity & Unhealthy Diets

- Poor diet and physical inactivity lead to 300,000 deaths each year—second only to tobacco use.
- People who are overweight or obese increase their risk for heart disease, diabetes, high blood pressure, arthritis-related disabilities, and some cancers.
- Not getting an adequate amount of exercise is associated with needing more medication, visiting a physician more often, and being hospitalized more often.

- National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

Nearly 3 in 10 LaSalle Parish adults (28.6%) report no leisure-time physical activity in the past month.

- Similar to the regional prevalence.
- Better than the percentage reported across Louisiana.
- Worse than national findings.
- Similar to the Healthy People 2020 objective.

Lack of leisure-time physical activity is statistically unchanged from 2002 survey findings.

- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 100]
- Behavioral Risk Factor Surveillance System (BRFSS) Survey Data, Atlanta, Georgia. United States Department of Health and Human Services, Centers for Disease Control and Prevention (CDC), 2011 Louisiana data.
- 2013 PRC National Health Survey, Professional Research Consultants.

Notes:
- Asked of all respondents.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.

Lack of leisure-time physical activity in the area is higher among:

- Women.
- Adults age 40 and older (note positive correlation with age).
Activity Levels

All adults should strive to meet either of the following physical activity recommendations:

- **Moderate-intensity physical activities** (inducing only light sweating or a slight to moderate increase in breathing or heart rate) for at least 30 minutes on 5 or more days of the week.
  
  – Centers for Disease Control and Prevention/American College of Sports Medicine

OR

- **Vigorous-intensity physical activity** (inducing heavy sweating or a large increase in breathing or heart rate) 3 or more days per week for 20 or more minutes per occasion.
  
  – Healthy People 2020

**Recommended Levels of Physical Activity**

A total of 42.8% of LaSalle Parish adults participate in regular, sustained moderate or vigorous physical activity (meeting physical activity recommendations).

- Similar to the regional prevalence.
- Less favorable than national findings.
- Denotes no significant change over time.
**Meets Physical Activity Recommendations**

Adults less likely to meet physical activity requirements include:

- **Women.**
- **Adults age 40+.**

**Moderate & Vigorous Physical Activity**

In the past month, 28.4% of adults participated in moderate physical activity (5 times a week, 30 minutes at a time).

- Similar to what was found throughout the RFSA.
- Similar to the national figure.

Participation in regular, moderate-intensity physical activity has remained statistically unchanged in the service area since 2002.
Moderate physical activity decreases with age and is statistically lower among women.

**Moderate Physical Activity**

(LaSalle Parish, 2013)

A total of 33.3% participated in vigorous physical activity (3 times a week, 20 minutes at a time).

- Comparable to what was found throughout the RFSA.
- Comparable to the nationwide figure.

Despite a dip since 2010, this marks a significant increase since 2002.
Vigorous physical activity is statistically lower among women and adults age 40+ (note the positive correlation with age).

**Strengthening Activities**

In the past month:

A total of 24.9% of adults regularly participate in strengthening activities (at least twice weekly) – these are activities designed to strengthen muscles, such as lifting weights or doing calisthenics.

- Similar to what was found throughout the RFSA.
- Statistically unchanged from 2002 survey findings.
Adults less likely to report participating in strengthening exercises at least twice weekly include:

- Women.
- Adults 40 and older.
- Those in households with lower incomes.

Strengthening Activity
(LaSalle Parish, 2013)
Walking

A total of 28.7% of LaSalle Parish adults typically walk regularly (at least five times per week for more than 10 minutes at a time).

Average Number of Days Per Week on Which Respondent Walks for More Than 10 Minutes at a Time

Health Advice About Physical Activity & Exercise

A total of 41.3% of LaSalle Parish adults report that their physician has asked about or given advice to them about physical activity in the past year.

- Similar to what was found throughout the RFSA.
- Comparable to the national average.

Note: only 54.5% of obese LaSalle Parish respondents say that they have talked with their doctor about physical activity/exercise in the past year, lower than found nationally (60.6%).
Children’s Physical Activity

Participation in Physical Activity

Overall, 71.3% of LaSalle Parish parents of children 5-17 report that their child is physically active on a regular basis (defined as 3+ days per week of vigorous physical activity or 5+ days per week of moderate activity).

- Lower than regional (RFSA) findings.

Child Is Physically Active on a Regular Basis
(Among LaSalle Parish Parents of Children Aged 5-17, 2013)
Children’s Moderate Physical Activity

58.2% of children engage in regular moderate physical activity (5+ times per week for 30+ minutes at a time).

- Comparable to regional (RFSA) findings.

• Screen time includes video games and computer/Internet use.
• “3+ Hours” = 180 or more minutes of reported non-TV screen time per school day.
Total Screen Time

On a typical school day, 41.9% of school-age LaSalle Parish children spend 3+ hours watching television, playing video games, or using the computer/Internet for entertainment.

- Similar to regional (RFSA) findings.
- Statistically similar to the US findings.

Children With Three or More Hours per School Day of Total Screen Time [TV, Computer, Video Games, Etc. for Entertainment]
(Among Parents of Children 5-17)

Availability of Opportunities for Physical Activity

Half (50.1%) of survey respondents give “excellent” or “very good” ratings of the availability of opportunities for physical activity in their community.

- Another 16.2% gave “good” ratings.
In contrast, one-third (33.7%) of LaSalle Parish adults gave “fair/poor” ratings of the availability of opportunities for physical activity within the community.

- Similar to regional (RFSA) findings.
- Marks a significant decrease since 2010.

“Fair” or “Poor” Evaluations of the Availability of Opportunities to Participate in Physical Activity in the Community

There are no significant difference between demographic groups.

“Fair” or “Poor” Evaluations of the Availability of Opportunities to Participate in Physical Activity in the Community
Community Participation in Physical Activity

Many LaSalle Parish adults (34.3%) report that they “rarely” or “never” see others in their community being physically active, such as walking, jogging or biking.

- Another 26.2% reported “sometimes” seeing other community members being physically active.

<td>46.4%</td>
</tr>
</tbody>
</table>

Sources: 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 105]
Notes: Asked of all respondents.
Many focus group participants discussed the lack of physical activity in the community. The main discussion centered on:

- Low physical activity levels
- Technology (television or computer)
- Walking path
- Summer sport program

Participants have differing views about the activity levels of residents in the community. Several focus group attendees feel that many community members live sedentary lifestyles. These low physical activity levels increase the obesity rates in the parish. A respondent clarifies:

“Just have a lot of folks that are way, way, way overweight. I mean, that's just a huge issue — and people that do zero exercise, and it doesn't matter how much you encourage them. Not going to do it.” — LaSalle Parish Key Informant

The amount of time that residents spend in front of the television or computer distresses focus group members. A child’s day no longer includes regular physical activity because of the new technology; children and adolescents watch more television and play more video games than ever before, as an attendee describes:

“The younger crowd is tethered to the computer and the games. And, I think that's a scourge on society. All I can think about is get home to play the games.” — LaSalle Parish Key Informant

Other focus group members believe that the community is active:

“A lot of people do get outside and do all sort of outdoor activities, from hunting, to fishing, to raising a garden, to cutting firewood.” — LaSalle Parish Key Informant

Many residents utilize the walking path regularly.

“It's (the walking path) just been a huge runaway success. And, then within the last year the walking track has been extended up towards downtown, and I guess it's gonna go all over the place eventually.” — LaSalle Parish Key Informant

La Salle Parish also runs a successful summer sport programs, but attendees feel that the participation in summer baseball is slowly decreasing, as a key informant explains:

“We had a fantastic summer baseball program ever since I can remember. It's just been marvelous. A great deal of participation for kids, the family, the grandparents — everybody and his brother. And, that's coming close to dying off now, and part of the problem, at least from my view point, is the fact that we have all these new programs something called travel ball. Where you form a team, say, from Jena La Salle area that plays all over the countryside. And, you're taking kids maybe from Alexandria, or Baton Rouge, or something like that. But, you take a significant number of kids out of our summer programs, it's detrimental to those kids who can’t afford to play travel ball, and it takes that opportunity away from them. It's one of those things that kind of, as much as I love baseball, it gets under my skin.” — LaSalle Parish Key Informant
Substance Abuse

Substance abuse and its related problems are among society’s most pervasive health and social concerns. Each year, about 100,000 deaths in the United States are related to alcohol consumption. Illicit drug abuse and related acquired immunodeficiency syndrome (AIDS) deaths account for at least another 12,000 deaths. In 1995, the economic cost of alcohol and drug abuse was $276 billion. This represents more than $1,000 for every man, woman, and child in the United States to cover the costs of healthcare, motor vehicle crashes, crime, lost productivity, and other adverse outcomes of alcohol and drug abuse.

A substantial proportion of the population drinks alcohol. Alcohol use and alcohol-related problems also are common among adolescents. Excessive drinking has consequences for virtually every part of the body. The wide range of alcohol-induced disorders is due (among other factors) to differences in the amount, duration, and patterns of alcohol consumption, as well as differences in genetic vulnerability to particular alcohol-related consequences. Alcohol use has been linked with a substantial proportion of injuries and deaths from motor vehicle crashes, falls, fires, and drownings. It also is a factor in homicide, suicide, marital violence, and child abuse and has been associated with high-risk sexual behavior.

Alcohol Use

High-Risk Alcohol Use

Chronic Drinking

A total of 2.0% of area adults averaged two or more drinks of alcohol per day in the past month (chronic drinkers).

- Lower than regional (RFSA) findings.
- Lower than the national figure.
- The chronic drinking prevalence has remained statistically unchanged since 2002.

Chronic Drinkers

Sources: ● PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 206]
● 2013 PRC National Health Survey, Professional Research Consultants.

Notes:
● Asked of all respondents.
● Chronic drinkers are defined as having 60+ alcoholic drinks in the past month.
Chronic drinking is reported more often among:

- Adults age 40 and older.

### Chronic Drinkers
(LaSalle Parish, 2013)

<table>

Notes: ● Asked of all respondents.

- Income categories reflect respondent’s household income as a ratio to the federal poverty level for their household size: very low income = below poverty; low income = 100% to 200% of poverty; middle/high income = over 200% of poverty.
- Chronic drinkers are defined as those having 60+ alcoholic drinks in the past month.

### Binge Drinking

A total of 11.1% of LaSalle Parish adults are binge drinkers.

- Similar to regional (RFSA) findings.
- Lower than the prevalence in Louisiana.
- Lower than the prevalence reported nationwide.
- Satisfies the Healthy People 2020 target.
- Statistically unchanged since 2002.

Binge drinkers include:
1) MEN who report drinking 5 or more alcoholic drinks on any single occasion during the past month; and
2) WOMEN who report drinking 4 or more alcoholic drinks on any single occasion during the past month.

### Binge Drinkers

Healthy People 2020 Target = 24.4% or Lower

**Binge Drinking & Driving**

A total of 0.0% of LaSalle Parish adults acknowledge having driven a vehicle in the past month after they had perhaps too much to drink.

- Better than what was found regionally.
- Lower than the national figure.

The drinking and driving prevalence has decreased since 2002.

**Have Driven in the Past Month**  
*After Perhaps Having Too Much to Drink*

Note: As a self-reported measure – and because this indicator reflects potentially illegal behavior – it is reasonable to expect that it might be underreported, and that the actual incidence of drinking and driving in the community is likely higher.
In the past month, 0.7% of LaSalle Parish adults have ridden with a driver who had perhaps too much to drink.

- Lower than regional (RFSA) findings.
- Lower than the national figure.
- The prevalence has remained unchanged since 2005.

A total of 0.7% of LaSalle Parish adults acknowledge either drinking and driving or riding with a drunk driver in the past month.

- Lower than regional (RFSA) findings.
- Much lower than the national percentage.
- Marks a significant decrease over time.
Illicit Drug Use

Illegal use of drugs, such as heroin, marijuana, cocaine, and methamphetamine, is associated with other serious consequences, including injury, illness, disability, and death, as well as crime, domestic violence, and lost workplace productivity. Drug users and persons with whom they have sexual contact run high risks of contracting gonorrhea, syphilis, hepatitis, tuberculosis, and human immunodeficiency virus (HIV). The relationship between injection drug use and HIV/AIDS transmission is well known. Injection drug use also is associated with hepatitis B and C infections. Long-term consequences, such as chronic depression, sexual dysfunction, and psychosis, may result from drug use.

Although there has been a long-term drop in overall use, many people in the United States still use illicit drugs. Drug use among adolescents age 12 to 17 years doubled between 1992 and 2005. Drug and alcohol use by youth also is associated with other forms of unhealthy and unproductive behavior, including delinquency and high-risk sexual activity.

A total of 0.3% of LaSalle Parish adults acknowledge using an illicit drug in the past month.

- Lower than regional (RFSA) findings.
- Lower than the percentage reported across the nation.
- Satisfies the Healthy People 2020 objective.
- No significant change from previous findings.

For the purposes of this survey, “illicit drug use” includes use of illegal substances or of prescription drugs taken without a physician’s order.

Note: As a self-reported measure – and because this indicator reflects potentially illegal behavior – it is reasonable to expect that it might be underreported, and that actual illicit drug use in the community is likely higher.

Healthy People 2020 Target = 11.3 or Lower

Sources:
- CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted July 2013.

Notes:
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.
- Local, state and national data are simple three-year averages.
- * Due to low numbers of deaths: the rate for LaSalle Parish represents 2001-2010 data.
- NOTE: 2006-2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.

Alcohol & Drug Treatment

The stigma attached to substance abuse increases the severity of the problem. The hiding of substance abuse, for example, can prevent persons from seeking and continuing treatment and from having a productive attitude toward treatment. Compounding the problem is the gap between the number of available treatment slots and the number of persons seeking treatment for illicit drug use or problem alcohol use.

A total of 0.6% of LaSalle Parish adults say that they have sought professional help for an alcohol or drug problem at some point in their lives.

- Lower than regional (RFSA) findings.
- Lower than the prevalence reported across the nation.
- Statistically unchanged over time.

Notes: ● Asked of all respondents.

Related Focus Group Findings: Substance Abuse

Substance abuse was discussed during the focus group with emphasis on:

- Prevalence of drug use
- Cost of substance abuse treatment programs

A number of focus group participants think that the prevalence of drug use in LaSalle Parish is no worse than in other communities and most likely less of a problem. Attendees recognize that substance use occurs in the community and describe methamphetamines, cocaine, crack cocaine, and marijuana as the most common.

Attendees feel that the community needs additional substance abuse treatment programs, specifically for low income residents. Only a limited number of organizations provide substance abuse treatment and few will accept uninsured, or those that cannot pay.

“'The folks who don’t have resources I think that it’s difficult to go to a ‘treatment center.’ And, if you don’t have money, they don’t want you. That’s the truth.” — LaSalle Parish Key Informant
Tobacco Use

Cigarette smoking causes heart disease, several kinds of cancer (lung, larynx, esophagus, pharynx, mouth, and bladder), and chronic lung disease. Cigarette smoking also contributes to cancer of the pancreas, kidney, and cervix. Smoking during pregnancy causes spontaneous abortions, low birthweight, and sudden infant death syndrome. Other forms of tobacco are not safe alternatives to smoking cigarettes.

Tobacco use is responsible for more than 430,000 deaths per year among adults in the United States [about 20% of all deaths]... If current tobacco use patterns persist in the United States, an estimated 5 million persons under age 18 years will die prematurely from a smoking-related disease. Direct medical costs related to smoking total at least $50 billion per year [other sources estimate more than $75 billion in 1998 (about 8% of the personal healthcare expenditures in the US)]; direct medical costs related to smoking during pregnancy are approximately $1.4 billion per year.

Evidence is accumulating that shows maternal tobacco use is associated with mental retardation and birth defects such as oral clefts. Exposure to secondhand smoke also has serious health effects. Researchers have identified more than 4,000 chemicals in tobacco smoke; of these, at least 43 cause cancer in humans and animals. Each year, because of exposure to secondhand smoke, an estimated 3,000 nonsmokers die of lung cancer, and 150,000 to 300,000 infants and children under age 18 months experience lower respiratory tract infections.

Cigarette Smoking

Cigarette Smoking Prevalence

A total of 23.5% of LaSalle Parish adults currently smoke cigarettes, either regularly (20.6% every day) or occasionally (2.9% on some days).

- Similar to what was found throughout the RFSA.
- Similar to state findings.
- Higher than national findings.
- Fails to satisfy the Healthy People 2020 target.
The current smoking percentage is statistically similar to that reported in LaSalle Parish in 2002.

Current Smokers

Healthy People 2020 Target = 12.0% or Lower

Includes 20.6% of adults who smoke every day, and 2.9% who smoke on some days.

- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents.
- Includes regular and occasional smokers (everyday and some days).
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.

Cigarette smoking is more prevalent among:

- Adults under age 65 (note negative correlation with age).
- Low income residents.

Note also:

19.5% of women of child-bearing age (ages 18 to 44) currently smoke. This is notable given that tobacco use increases the risk of infertility, as well as the risks for miscarriage, stillbirth and low birthweight for women who smoke during pregnancy.

Current Smokers
(LaSalle Parish, 2013)

Among women 18-44, 19.5% are regular or occasional smokers.

- Income categories reflect respondent’s household income as a ratio to the federal poverty level for their household size: very low income” = below poverty, “low income” = 100% to 200% of poverty, “middle/high income” = over 200% of poverty.
Environmental Tobacco Smoke

A total of 11.9% of LaSalle Parish adults (including smokers and non-smokers) report that a member of their household has smoked cigarettes in the home in the past month an average of four or more times per week.

- Better than the regional finding.
- Similar to the national finding.
- This indicator has improved over time.

Note that 4.7% of LaSalle Parish non-smokers are exposed to cigarette smoke at home, similar to the US prevalence.

Member of Household Smokes at Home

Note that 4.7% of non-smokers are exposed to smoke in the home. (US = 6.3%)

Notes: ● Asked of all respondents.
In the past year or so, just over one in three parents (21.9%) feel that their child has talked to them “less” about tobacco control activities in his or her school.

- 75.8% feel the amount of discussion has not changed over the past year or so (“about the same”) while fewer (2.3%) believe that their child has talked with them “more” about school tobacco control activities.

**In the Past Year or So, Child Has Talked With Parents More/Less/Same Regarding School Tobacco Control Activities**

(LaSalle Parish Parents of Children Age 12-17, 2013)

- Much lower than regional (RFSA) findings.
- Marks a significant decrease from 2010 survey findings.

**Child Has Talked With Parents More in the Past Year or So Regarding School Tobacco Control Activities**

(LaSalle Parish Parents of Children Age 12-17, 2013)
Public Perceptions of Smoking

The majority of LaSalle Parish survey respondents believes that most people are against smoking, indicating that the public feels a person “definitely should not smoke” (34.6%) or “probably should not smoke” (41.6%).

- Another 11.7% believe that the general public opinion is that it is “okay to smoke sometimes,” and another 12.1% believe that public opinion says it is okay to smoke “as much as a person wants.”

Perception of How Most People in the Community Feel About Adults Smoking (LaSalle Parish, 2013)

The proportion of respondents who feel that people “definitely should not smoke” is similar to regional (RFSA) findings. However, this marks a significant decrease over time.

Respondent Perceives That Most People in the Community Believe That Adults Definitely Should Not Smoke (LaSalle Parish, 2013)
Respondents age 40 or older (especially seniors) are more likely to feel that most people believe that a person definitely should not smoke.

**Respondent Perceives That Most People in the Community Believe That Adults Definitely Should Not Smoke**  
(LaSalle Parish, 2013)

![Bar chart showing percentage of respondents by age and income category who believe most people believe that adults definitely should not smoke.]

**Other Tobacco Use**

**Smokeless Tobacco Use**

A total of 10.0% of LaSalle Parish adults use chewing tobacco or snuff every day or on some days.

- Similar to what was found throughout the RFSA.
- Significantly higher than the national percentage.
- Fails to satisfy the Healthy People 2020 target.

Smokeless tobacco use in LaSalle Parish is significantly higher since 2002.

**Use of Smokeless Tobacco**

![Bar chart showing percentage of respondents in LaSalle Parish and RFSA by year who use smokeless tobacco, compared to the Healthy People 2020 target.]

Sources:  
- PRC Community Health Surveys, Professional Research Consultants, Inc.  
- 2013 PRC National Health Survey, Professional Research Consultants.  

Notes:  
- Asked of all respondents.
- Smokeless tobacco includes chewing tobacco or snuff.
Related Focus Group Findings: Tobacco

Many focus group participants are concerned with tobacco use in the community:

- Young adults

Focus group participants worry about the negative health consequences of tobacco use and smokeless tobacco. Respondents think that many young adults smoke cigarettes and this number is increasing.
SELF-REPORTED HEALTH STATUS
Overall Health Status

Self-Reported Health Status

A total of 46.6% of LaSalle Parish adults rate their overall health as “excellent” or “very good.”

- Another 27.5% gave “good” ratings of their overall health.

Over one-fourth (25.9%) of adults believes that their overall health is “fair” or “poor.”

- Similar to regional (RFSA) findings.
- Similar to the Louisiana prevalence.
- Higher than the national percentage.

Overall, “fair/poor” responses have remained statistically unchanged in LaSalle Parish since the 2002 survey.

Sources: 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 5]
Notes: Asked of all respondents.
Adults more likely to report experiencing “fair” or “poor” overall health include:

- Seniors (note the positive correlation with age).
- Residents living at lower incomes.

**Activity Limitations**

An estimated 54 million persons in the United States currently live with disabilities. The increase in disability among all age groups indicates a growing need for public health programs serving people with disabilities.

The direct medical and indirect annual costs associated with disability [in the US] are more than $300 billion, or 4 percent of the gross domestic product. This total cost includes $160 billion in medical care expenditures (1994 dollars) and lost productivity costs approaching $155 billion.

The health promotion and disease prevention needs of people with disabilities are not nullified because they are born with an impairing condition or have experienced a disease or injury that has long-term consequences. People with disabilities have increased health concerns and susceptibility to secondary conditions. Having a long-term condition increases the need for health promotion that can be medical, physical, social, emotional, or societal.
A total of 27.9% of LaSalle Parish adults are limited in some way in some activities due to a physical, mental or emotional problem.

- Similar to regional (RFSA) findings.
- Similar to the state prevalence.
- Less favorable than the prevalence nationwide.
- Unchanged since 2002.

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. (Item 118)
- 2013 PRC National Health Survey, Professional Research Consultants.

Notes:
- Asked of all respondents.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.

In looking at responses by key demographic characteristics, note the following:

- Adults age 40 or older are much more often limited in activities.
- Residents living with very low or low income are more likely to have activity limitations.

A total of 17.9% of adults with activity limitations note that their impairment is due to a work-related illness or injury (similar to the 20.0% reported in 2002).
Among persons reporting activity limitations, these are most often attributed to musculoskeletal issues, such as back/neck problems, arthritis/rheumatism, fractures/joint injuries, or problems walking.

Other problems mentioned include lung/breathing problems, heart conditions, and emotional/mental problems.
Days of Limited Activity

While 72.2% of LaSalle Parish adults report no days in the past month when poor physical or mental health prevented their usual activities, 22.2% report experiencing four or more such days.

- Close to regional findings.
- Unchanged over time.

Experience Four or More Days in the Past Month on Which Physical or Mental Health Prevented Usual Activities

Adults more likely to indicate that health limited their usual activities include:

- Respondents with lower incomes.

Experience Four or More Days in the Past Month on Which Poor Physical/Mental Health Prevented Usual Activities (LaSalle Parish, 2013)

Sources: PRC Community Health Survey, Professional Research Consultants, Inc. (Item 8)
Notes: Asked of all respondents.
Physical Health

In the past month, LaSalle Parish adults averaged 6.3 days on which their physical health was not good.

- Similar to regional (RFSA) findings.
- The current average is similar to the 2010 average.

Average Number of Days in the Past Month on Which Respondents’ Physical Health Was Not Good

Adults more likely to report days when physical health was not good include:

- Residents with lower incomes.

Average Number of Days in the Past Month on Which Respondents’ Physical Health Was Not Good (LaSalle Parish, 2013)
Mental health is a state of successful performance of mental function, resulting in productive activities, fulfilling relationships with other people, and the ability to adapt to change and to cope with adversity. Mental health is indispensable to personal well-being, family and interpersonal relationships, and contribution to community or society. Mental disorders are health conditions that are characterized by alterations in thinking, mood, or behavior (or some combination thereof), which are associated with distress and/or impaired functioning and spawn a host of human problems that may include disability, pain, or death. Mental illness is the term that refers collectively to all diagnosable mental disorders.

Mental disorders generate an immense public health burden of disability. The World Health Organization, in collaboration with the World Bank and Harvard University, has determined that the impact of mental illness on overall health and productivity in the United States and throughout the world often is profoundly underrecognized [Global Burden of Disease study]. In established market economies such as the United States, mental illness is on a par with heart disease and cancer as a cause of disability. Suicide—a major public health problem in the US—occurs most frequently as a consequence of a mental disorder.

Mental disorders occur across the lifespan, affecting persons of all racial and ethnic groups, both genders, and all educational and socioeconomic groups.

As the life expectancy of individuals continues to grow longer, the sheer number—although not necessarily the proportion—of persons experiencing mental disorders of late life will expand. This trend will present society with unprecedented challenges in organizing, financing, and delivering effective preventive and treatment services for mental health.

"Now thinking about your mental health, which includes stress, depression and problems with emotions, would you say that, in general, your mental health is: excellent, very good, good, fair or poor?"

A total of 59.9% of LaSalle Parish adults rate their overall mental health as "excellent" or "very good."

- Another 25.3% gave "good" ratings of their own mental health status.

Days of Feeling Sad, Blue or Depressed

LaSalle Parish adults average 3.2 days per month when they felt sad, blue, or depressed.

- Similar to regional (RFSA) findings.
- Similar to most prior survey findings (although down slightly from 2010).

Average Number of Days Felt Sad, Blue, or Depressed in Past Month

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. (Item 114)
Notes: Asked of all respondents.

Averages are higher among lower income residents in LaSalle Parish.

Average Number of Days Felt Sad, Blue, or Depressed in Past Month
(LaSalle Parish, 2013)

Sources: 2013 PRC Community Health Survey, Professional Research Consultants, Inc. (Item 114)
Notes: Asked of all respondents.

- Income categories reflect respondent’s household income as a ratio to the federal poverty level for their household size: very low income” = below poverty; “low income” = 100% to 200% of poverty; “middle/high income” = over 200% of poverty.
A total of 10.8% of LaSalle Parish adults report having been diagnosed with major depression by a physician at some point in their lives.

- Lower than what was found in the RFSA.

Note that the prevalence of diagnosed major depression is notably higher among:

- Women.
- Adults between the ages of 40 and 64.
- Community members living at lower income levels.
Symptoms of Chronic Depression

A total of 27.2% of LaSalle Parish adults have had two or more years in their lives when they felt depressed or sad on most days, although they may have felt okay sometimes.

- Comparable to regional (RFSA) findings.
- Comparable to national findings.
- Significantly lower than 2002 survey findings.

Have Experienced Symptoms of Chronic Depression

Note that the prevalence of chronic depression is notably higher among:

- Adults between the ages of 40 and 64.
- Community members living at lower income levels.

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. (Item 113)
Notes: Asked of all respondents.

Income categories reflect respondent’s household income as a ratio to the federal poverty level for their household size: very low income = below poverty; “low income” = 100% to 200% of poverty; “middle/high income” = over 200% of poverty.
Mental Health Treatment

Modern treatments for mental disorders are highly effective, with a variety of treatment options available for most disorders, [however], the majority of persons with mental disorders do not receive mental health services.

Evidence that mental disorders are legitimate and highly responsive to appropriate treatment promises to be a potent antidote to stigma. Stigma creates barriers to providing and receiving competent and effective mental health treatment and can lead to inappropriate treatment, unemployment, and homelessness.

The co-occurrence of addictive disorders among persons with mental disorders is gaining increasing attention from mental health professionals. Having both mental and addictive disorders is a particularly significant clinical treatment issue, complicating treatment for each disorder.

Seeking Help

Among adults with chronic depression, 39.6% acknowledge that they have sought professional help for a mental or emotional problem.

- Similar to corresponding regional (RFSA) findings.
- Lower than national findings.
- The percentage of LaSalle Parish adults with chronic depression who sought professional help in the past year has not statistically changed since 2002, though decreased from 2010.
- Of those seeking help, 90.8% report getting the services they needed.

### Have Sought Professional Help for a Mental or Emotional Problem
(Among Residents With Chronic Depression, 2013)

Notes: ● Asked of those respondents who have experienced chronic depression.
Taking Medication and/or Receiving Treatment

A total of 11.7% of LaSalle Parish adults are currently taking medication or receiving treatment from a doctor or other health professional for some type of mental health condition or emotional problem.

- Similar to regional (RFSA) findings.

Currently Taking Medication or Receiving Treatment for a Mental Health Condition or Emotional Problem

Note that mental health treatment is more common among:

- Women.
- Adults age 40 to 64.
- Lower income residents.

Currently Taking Medication or Receiving Treatment for a Mental Health Condition or Emotional Problem (LaSalle Parish, 2013)

Sources: 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 117]
Notes: Asked of all respondents.

Income categories reflect respondent’s household income as a ratio to the federal poverty level for their household size: very low income = below poverty; low income = 100% to 200% of poverty; middle/high income = over 200% of poverty.
Health Professional Shortage Areas: Mental Health Care

**Mental Health** designations are approved by the federal Office of Shortage Designation (OSD) in the Health Resources and Services Administration (HRSA). Louisiana’s Bureau of Primary Care and Rural Health (BPCRH) looks at the number of Psychiatrists only to calculate an area’s mental health ratio. A ratio of 30,000:1 is required. The ratio for High Needs is 20,000:1.

For each of the three HPSA Designation types, there are three sub-categories, which include:

- **Geographic designations**—these take into account the entire population of the requested area to all available psychiatrists.
- **Population Group designations**—these are special groups. The most common of these are Low Income and Medicaid-Eligible designations. Low income designations use a ratio built upon the low income population of the area and the physicians providing services to this population. Medicaid-eligible designations are based on the number of Medicaid-eligible people and the physicians that accept Medicaid.
- **Facility designations**—these look at a facility’s outpatient census, waiting times, patients’ residences and in-house faculty to evaluate a facility’s designation eligibility.

LaSalle Parish is a geographically designated HPSAs for mental health.
Focus group members discussed the fragmented mental health system and the limited services available to residents, with focus on:

- Inadequate number of psychiatrists and treatment facilities

During the focus group, issues surrounding mental health services arose. Overall, the community suffers due to an inadequate number of psychiatrists, counselors, and treatment facilities available to address residents’ behavioral health needs, even for those with insurance. Primary care doctors must fill this gap and treat the community members suffering with mental illness.

“We don’t have enough psychiatrists. We don’t have enough mental health facility for people who really need it. We don’t have on-going treatment availability. I mean, my perception is that the primary care doctors do most of the treatment of those patients. And, largely it’s fine. It’s adequate, but sometimes you need somebody with a little higher level. It’s just not readily available to them.” — LaSalle Parish Key Informant
BIRTHS
Birth Rates

Between 2010 and 2012, LaSalle Parish experienced 11.0 births per 1,000 population.

- Lower than what was found throughout the RFSA.
- Lower than the rate reported statewide.
- Lower than the national birth rate (which reflects 2009-2011 data).

The LaSalle Parish birth rate has decreased somewhat over time, similar to state and national trends.
Prenatal Care

Many risk factors can be mitigated or prevented with good pre-conception and prenatal care. Prenatal visits offer an opportunity to provide information about the adverse effects of substance use, including alcohol and tobacco during pregnancy, and serve as a vehicle for referrals to treatment services. The use of timely, high-quality prenatal care can help to prevent poor birth outcomes and improve maternal health by identifying women who are at particularly high risk and taking steps to mitigate risks, such as the risk of high blood pressure or other maternal complications.

African American and Hispanic women also are less likely than Whites to enter prenatal care early. For both African American and White women, the proportion entering prenatal care in the first trimester rises with maternal age until the late thirties, then begins to decline ... Women in certain racial and ethnic groups also are less likely than White women to breastfeed their infants.

Between 2007 and 2009, 5.1% of LaSalle Parish births did not receive early and adequate prenatal care.

- More favorable than the regional proportion.
- More favorable than the Louisiana proportion.

Birth Outcomes & Risks

The health of mothers, infants, and children is of critical importance, both as a reflection of the current health status of a large segment of the US population and as a predictor of the health of the next generation. Infant mortality is an important measure of a nation’s health and a worldwide indicator of health status and social well-being. As of 1995, the US infant mortality rates ranked 25th among industrialized nations. In the past decade, critical measures of increased risk of infant death, such as new cases of low birth weight (LBW) and very low birth weight (VLBW), actually have increased in the United States. In addition, the disparity in infant mortality rates between Whites and specific racial and ethnic groups (especially African Americans, American Indians or Alaska Natives, Native Hawaiians, and Puerto Ricans) persists. Although the overall infant mortality rate has reached record low levels, the rate for African Americans remains twice that of Whites.

LBW is associated with long-term disabilities, such as cerebral palsy, autism, mental retardation, vision and hearing impairments, and other developmental disabilities. The general category of LBW infants includes both those born too early (preterm infants) and those who are born at full term but who are too small, a condition known as intrauterine growth retardation (IUGR). Maternal characteristics that are risk factors associated with IUGR include maternal LBW, prior LBW birth history, low prepregnancy weight, cigarette smoking, multiple births, and low pregnancy weight gain. Cigarette smoking is the greatest known risk factor.

Low-Weight Births

A total of 7.5% of 2010-2012 LaSalle Parish births were low weight.

- More favorable than found regionally.
- More favorable than the Louisiana proportion.
- More favorable than the national proportion (which reflects 2009-2011 data).
- Similar to the Healthy People 2020 target.

Low birthweight babies, those who weigh less than 2,500 grams (5 pounds, 8 ounces) at birth, are much more prone to illness and neonatal death than are babies of normal birthweight.

Largely a result of receiving poor or inadequate prenatal care, many low-weight births and the consequent health problems are preventable.
This proportion has decreased in LaSalle Parish in recent years.

### Family Planning

In an era when technology should enable couples to have considerable control over their fertility, half of all pregnancies in the United States are unintended. Although between 1987 and 1994 the proportion of pregnancies that were unintended declined in the United States from 57 to 49 percent, other industrialized nations report fewer unintended pregnancies, suggesting that the number of unintended pregnancies can be reduced further. Family planning remains a keystone in attaining a national goal aimed at achieving planned, wanted pregnancies and preventing unintended pregnancies.

Socially, the costs can be measured in unintended births, reduced educational attainment and employment opportunity, greater welfare dependency, and increased potential for child abuse and neglect. Economically, healthcare costs are increased . . . The consequences of unintended pregnancy are not confined to those occurring in teenagers or unmarried couples. In fact, unintended pregnancy can carry serious consequences at all ages and life stages.

With an unintended pregnancy, the mother is less likely to seek prenatal care in the first trimester and more likely not to obtain prenatal care at all. She is less likely to breastfeed and more likely to expose the fetus to harmful substances, such as tobacco or alcohol. The child of such a pregnancy is at greater risk of low birth weight, dying in its first year, being abused, and not receiving sufficient resources for healthy development. A disproportionate share of the women bearing children whose conception was unintended are unmarried or at either end of the reproductive age span—factors that, in themselves, carry increased medical and social burdens for children and their parents. Pregnancy begun without some degree of planning often prevents individual women and men from participating in preconception risk identification and management.

Unintended pregnancies occur among females of all socioeconomic levels and all marital status and age groups, but females under age 20 years and poor and African American women are especially likely to become pregnant unintentionally. More than 4 in 10 pregnancies to White and Hispanic females [nationwide] are unintended; 7 in 10 pregnancies to African American females [nationwide] are unintended. Poverty is strongly related to greater difficulty in using reversible contraceptive methods successfully, with these females also the least likely to have the resources necessary to access family planning services and the most likely to be affected negatively by an unintended pregnancy.

Births to Unwed Mothers

A total of 38.0% of 2010-2012 births were to women who were not married at the time.

- Lower than regional (RFSA) findings.
- Lower than the percentage reported statewide.
- Lower than that found nationally.

- Note that there is a break in data reporting years due to a lack of data; in addition the “2005-2007” LaSalle Parish percentage actually includes only 2006 and 2007 data.
- Regional and statewide data for 2012 represent preliminary data.

### Births to Teenage Mothers

For teenagers, the problems associated with unintended pregnancy are compounded, and the consequences are well documented. Teenage mothers are less likely to get or stay married, less likely to complete high school or college, and more likely to require public assistance and to live in poverty than their peers who are not mothers. Infants born to teenage mothers, especially mothers under age 15 years, are more likely to suffer from low birth weight, neonatal death, and sudden infant death syndrome. The infants may be at greater risk of child abuse, neglect, and behavioral and educational problems at later stages. Nearly 1 million teenage pregnancies occur each year in the United States.

A total of 12.6% of 2010-2012 births were to mothers under the age of 20.

- Similar to regional (RFSA) findings.
- Higher than the percentage reported across Louisiana.
- Higher than the percentage found nationally.
The percentage of births to mothers under age 20 in LaSalle Parish has decreased over time, echoing the state and national trends.

Tuberculosis

Tuberculosis (TB) is an infectious disease caused by a type of bacteria called Mycobacterium tuberculosis. TB is spread from person to person through the air, as someone with active tuberculosis of the respiratory tract coughs, sneezes, yells, or otherwise expels bacteria-laden droplets.

The Institute of Medicine (IOM), an arm of the National Academy of Sciences, released a report in May 2000 that lays out an action plan for eliminating tuberculosis in the United States. As a key part of the plan, new TB treatment and prevention strategies must be developed that are tailored to the current environment. Among today’s hallmarks:

- Tuberculosis now occurs in ever-smaller numbers in most regions of the country.
- Foreign-born people (both legal and undocumented immigrants) coming to the United States from countries with high rates of TB now account for nearly half of all TB cases.
- Higher numbers of cases are concentrated in pockets located in major metropolitan areas, and this increased prevalence is due, in large part, to the increased number of people with or at risk for HIV/AIDS infection.
- Other groups, such as HIV-infected people and the growing population of prison inmates, the homeless, and intravenous drug abusers, are emerging as being at high risk.

Between 2010 and 2012, the annual average tuberculosis incidence rate (new cases per year) was 4.4 cases per 100,000 population in LaSalle Parish.

- Higher than the regional incidence rate.
- Higher than the Louisiana incidence rate.
- Higher than the national incidence rate (which reflects 2009-2011 data).
- Fails to satisfy the Healthy People 2020 target.

Salmonellosis

The 2010-2012 salmonellosis incidence rate in LaSalle Parish was 55.8 per 100,000 population.

- Much higher than the regional incidence rate.
Salmonellosis Incidence
(2010-2012* Annual Average Cases per 100,000 Population)

Salmonellosis incidence has generally increased over time in LaSalle Parish, echoing the state trend. Incidence has increased nationally as well, although less sharply.

Campylobacteriosis

Between 2010 and 2012, LaSalle Parish reported a campylobacteriosis incidence rate of 8.9 cases per 100,000 population.

- Higher than the regional incidence rate.
- Higher than the Louisiana rate. (A national incidence rate is not available.)
Campylobacteriosis incidence has increased considerably in recent years in LaSalle Parish, as it has statewide.
In the United States, HIV/AIDS remains a significant cause of illness, disability, and death, despite declines in 2002 and 2005.

Principal health determinants. Behaviors (sexual practices, substance abuse, and accessing prenatal care) and biomedical status (having other STDs) are major determinants of HIV transmission. Unprotected sexual contact, whether homosexual or heterosexual, with a person infected with HIV and sharing drug-injection equipment with an HIV-infected individual account for most HIV transmission in the United States. Increasing the number of people who know their HIV serostatus is an important component of a national program to slow or halt the transmission of HIV in the United States.

For persons infected with HIV, behavioral determinants also play an important role in health maintenance. Although drugs are available specifically to prevent and treat a number of opportunistic infections, HIV-infected individuals also need to make lifestyle-related behavioral changes to avoid many of these infections. The new HIV antiretroviral drug therapies for HIV infection bring with them difficulties in adhering to complex, expensive, and demanding medication schedules, posing a significant challenge for many persons infected with HIV.

Because HIV infection weakens the immune system, people with tuberculosis (TB) infection and HIV infection are at very high risk of developing active TB disease.

Comparing the 1980s to the 1990s, the proportion of AIDS cases in White men who have sex with men declined, whereas the proportion in females and males in other racial and ethnic populations increased, particularly among African adults and Hispanics. AIDS cases also appeared to be increasing among injection drug users and their sexual partners. The true extent of the epidemic remains difficult to assess for several reasons, including the following:

- Because of the long period of time from initial HIV infection to AIDS and because highly active antiretroviral therapy (HAART) has slowed the progression to AIDS, new cases of AIDS no longer provide accurate information about the current HIV epidemic in the United States.
- Because of a lack of awareness of HIV serostatus as well as delays in accessing counseling, testing, and care services by individuals who may be infected or are at risk of infection, some populations do not perceive themselves to be at risk. As a result, some HIV-infected persons are not identified and provided care until late in the course of their infection.

Age-Adjusted HIV/AIDS Deaths

Between 2001 and 2010, there was an annual average age-adjusted HIV/AIDS mortality rate of 5.3 deaths per 100,000 population in the Rapides Foundation Service Area (parish-level data are not available).

- Lower than found statewide.
- Higher than found nationally.
- Fails to satisfy the Health People 2020 target.
HIV/AIDS mortality is dramatically higher among Blacks in the RFSA when compared with Whites (more than seven times higher, in fact). This disparity is also seen — and to an even greater degree — both statewide and nationally.

**HIV/AIDS Cases**

**HIV/AIDS Incidence**

Between 2009 and 2012, there was an annual average of 105.8 new HIV/AIDS cases per 100,000 population in LaSalle Parish.

- Much higher than the RFSA rate.
- Much higher than the Louisiana incidence rate.

**HIV/AIDS Incidence**
(2009–2012 Annual Average Cases per 100,000 Population)

LaSalle Parish: 105.8  
RFSA: 21.0  
LA: 26.1

Sources: Louisiana Department of Health and Hospitals Office of Public Health. 
Notes: Rates are annual average new cases per 100,000 population.
HIV/AIDS incidence in LaSalle Parish increased considerably between the two available reporting periods, as shown below.

- Rates are annual average new cases per 100,000 population.

### HIV/AIDS Characteristics

The following chart provides an illustration of the demographic characteristics of new HIV/AIDS cases (2009-2012) in the RFSA. Note:

- Incidence was more prevalent in **males**.
- **Black** residents made up the majority of new cases.
- The greatest proportion of new cases occurred in the **25-44** age groups.

### Characteristics of New HIV Cases

**Rapides Foundation Service Area, 2009-2012**

**Sources:** Louisiana Department of Health and Hospitals Office of Public Health.
As of the end of 2012, there were 17 LaSalle Parish residents living with HIV/AIDS. This represents 0.1% of the state’s 18,422 persons living with HIV/AIDS.

**Persons Living With HIV/AIDS**
(As of December 31, 2012)

Throughout Louisiana, there were 18,422 persons living with HIV/AIDS as of 12/31/2012. This represents 0.1% of the total statewide.

**HIV Testing**

Among LaSalle Parish adults age 18-44, 11.2% report that they have been tested for human immunodeficiency virus (HIV) in the past year.

- Lower than the rate found regionally.
- Similar to the proportion found nationwide.
- Similar to the Healthy People 2020 target.
- Denotes a significant decrease from 2002 survey findings.
Sexually Transmitted Diseases

Sexually transmitted diseases (STDs) refer to the more than 25 infectious organisms transmitted primarily through sexual activity. STDs are among many related factors that affect the broad continuum of reproductive health agreed on in 1994 by 180 governments at the International Conference on Population and Development (ICPD). At ICPD, all governments were challenged to strengthen their STD programs. STD prevention as an essential primary care strategy is integral to improving reproductive health.

Despite the burdens, costs, complications, and preventable nature of STDs, they remain a significant public health problem, largely unrecognized by the public, policymakers, and public health and healthcare professionals in the United States. STDs cause many harmful, often irreversible, and costly clinical complications, such as reproductive health problems, fetal and perinatal health problems, and cancer. In addition, studies of the worldwide human immunodeficiency virus (HIV) pandemic link other STDs to a causal chain of events in the sexual transmission of HIV infection.

---

**Gonorrhea**

Between 2010 and 2012, the annual average gonorrhea incidence rate was 40.2 cases per 100,000 population in LaSalle Parish.

- Much lower than the regional incidence rate.
- Much lower than the Louisiana rate.
- Much lower than the national incidence rate (which reflects 2009-2011 data).

Syphilis

Between 2010 and 2012, the annual average primary/secondary syphilis incidence rate was 4.5 cases per 100,000 population in LaSalle Parish.

- Lower than the regional incidence rate.
- Lower than the Louisiana incidence rate.
- Identical to the national incidence rate (which reflects 2009-2011 data).

- Asked of all unmarried respondents under the age of 65.
HOUSING
Housing Conditions

Type of Dwelling

The majority of LaSalle Parish residents (75.4%) owns their own home, while 9.3% rent a house or apartment.

- Another 7.0% live with family members.

Condition of Local Housing

Just under one-half (48.2%) of survey respondents consider the condition of homes in their neighborhoods to be “excellent” or “very good.”

- Another 35.5% gave good ratings.
However, 16.3% of LaSalle Parish residents consider the condition of homes in their neighborhoods to be only “fair” or “poor.”

- Similar to regional (RFSA) findings.
- This indicator remains statistically unchanged since 2005.

**Perceive Condition of Neighborhood Homes to Be “Fair” or “Poor”**

![Graph showing percentage of residents perceiving homes as fair or poor over time]

Sources: ● PRC Community Health Surveys, Professional Research Consultants, Inc. (Item 130)
Notes: ● Asked of all respondents.

Viewed by demographic segments, those residents more likely to give low ratings of the condition of neighborhood homes include the following:

- Residents living at lower incomes.

**Perceive Condition of Neighborhood Homes to Be “Fair” or “Poor”** *(LaSalle Parish, 2013)*

![Graph showing percentage of residents perceiving homes as fair or poor across different demographic groups]

Sources: ● 2013 PRC Community Health Survey, Professional Research Consultants, Inc. (Item 130)
Notes: ● Asked of all respondents.
*Income categories reflect respondent’s household income as a ratio to the federal poverty level for their household size: very low income” = below poverty; “low income” = 100% to 200% of poverty; “middle/high income” = over 200% of poverty.*
Housing Affordability

Availability of Affordable Housing

When asked to rate the availability of affordable local housing, 13.4% of survey respondents gave “excellent” or “very good” opinions.

- Another 28.3% gave “good” ratings.

Rating of the Availability of Affordable Local Housing

Sources: ● 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 127]
Notes: ● Asked of all respondents.

However, 58.3% of LaSalle Parish residents consider the availability of affordable housing in their areas to be “fair” or “poor.”

- Higher than regional (RFSA) findings.
- Unfavorably, this marks a significant increase in “fair/poor” ratings since this was first measured in 2005.

Perceive the Availability of Affordable Local Housing to Be “Fair” or “Poor”

Sources: ● PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 127]
Notes: ● Asked of all respondents.
Segmented by demographic characteristic, residents more likely to give low ratings of the availability of affordable homes in the community include:

- Residents under age 65 (note the negative correlation with age).
- Low income and very low income residents.
- As might be expected, survey respondents who rent are more likely to give low ratings than those who own their own homes.

**Perceive the Availability of Affordable Local Housing to Be “Fair” or “Poor”**
(LaSalle Parish, 2013)

Housing Displacement

A total of 13.8% of survey respondents report that they have had to go live with a friend or relative at some point in the past two years, even if only temporarily, because of an emergency.

- Similar to regional (RFSA) findings.
- Marks a significant increase over time.

**Had to Live With a Friend/Relative in the Past Two Years Due to an Emergency (Even if Only Temporarily)**
Segmented by demographic characteristic, those more likely to report having to live with a friend or relative in the past two years include:

- Young adults (note the negative correlation with age).
- Respondents with low or very low incomes.
- Renters (vs. homeowners).

**Had to Live With a Friend/Relative in the Past Two Years Due to an Emergency (Even if Only Temporarily)**

PERCEPTIONS OF TEEN ISSUES
In this instance, survey respondents were presented with five issues facing teenagers and asked to rate each as a "major problem," "moderate problem," "minor problem" or "no problem at all" in their own community.
OTHER ISSUES
Related Focus Group Findings

Participants spent time discussing the varying levels of collaboration occurring in the community between non-profit organizations, schools, healthcare providers and hospitals. The issues surrounding collaboration were:

- Varying opinions on the level of collaboration
- Geographic divide
- Live Lively LaSalle

Attendees had **varying opinions on the level of collaboration** occurring in the community. Attendees in LaSalle Parish feel that a **geographic divide** exists and intense competition continues to inhibit cooperation between the northern and southern sections of the parish:

“One issue we have is we have the north end and we have the central and south end of the parish. The north end of the parish – they’re their own deal. We have our own deal. Not much cooperation. In fact, there’s zero cooperation. You probably could call it competition. I mean, truth be known the parish has two hospitals. It needs one. There’s 17 or 20 miles down the road there’s another hospital. And the three small towns, or four small towns sits in there compete with each other. We’re trying to break that down, but it’s sure prevalent competition.” — LaSalle Parish Key Informant

“Everything in the parish is broken down on the south and the north. You have a high school down here; you have a high school up there. You have a summer program up there; you have a summer program down here. And, I remember one year I had an all-star team comprised of both the north side and the south side. And, the kids on the north side didn’t throw to the kids on the south side, and vice versa after about three days of practice. It’s that intense.” — LaSalle Parish Key Informant

However, a recent collaborative effort, the BlueCross BlueShield grant – **Live Lively LaSalle** – has brought together ten agencies throughout the parish and the mayors are working together for the first time; however, attendees feel that it will take much effort for the current mentality to change.
Older Adults

Related Focus Group Findings

Many focus group participants discussed the available services to senior citizens, with emphasis on the following:

- Aging population
- Need an assisted living facility

Participants believe that LaSalle Parish has an **aging population**. LaSalle Parish has multiple healthcare organizations and resources for seniors, which include the Council on Aging, Meals on Wheels, two nursing homes and a Senior Citizen Center. Several attendees believe that an **assisted living facility** would benefit the community in the future.
Quality of Life

Related Focus Group Findings

Many focus group participants discussed the quality of life in the parish and the factors that contribute to it included:

- Positive reviews about the quality of life
- Low unemployment rate

Focus group attendees had positive comments about the quality of life in LaSalle Parish. Participants tout the area as having a great educational system and all of the key informants describe the city of Jena and LaSalle Parish as an excellent place to live.

"The people live here basically love Jena, but it's a little bit off the beaten path. You kind of have to be headed here to come here, but by the same token, over the decades we have maintained our own identity as a community as opposed to a lot of these small towns who are just kind of ghost towns. Our town is not. And, that's really good. I mean, it is a great, great place to live, raise your children." — LaSalle Parish Key Informant

"I could live anywhere in the world, and I elected to live here because quality of life. And, that is because you can always find a support system for you here. It's the people. It's also those little things that you can find to do if you want to find those things to do. So, if you ask me what the quality of life is, I'd say A+ in this area." — LaSalle Parish Key Informant

Respondents describe the parish as a majority middle class area and a community where "everyone knows your name" and looks out for one another:

"When my son was a teenager, and I would walk into the sheriff's office on Monday morning and the deputies would tell me where he'd been all weekend. I'd say something to him, 'What were you doing over at the telephone booth there next to the church? Who were you calling at 10:00 Saturday night?' 'How did you know about that?' It used to drive him crazy." — LaSalle Parish Key Informant

Education, oil well production, and timber represent the main industries in the parish and the unemployment rate is very low. However, for those residents that have a college degree finding a position that can utilize the degree may prove difficult.

"If there is a problem with that respect, it's being able to provide kids who go off to college with opportunity. Like I say, if you want a job, there's one here for you. But, if you're looking for a job in finance or a job that requires an education degree, then you may have a problem in that respect." — LaSalle Parish Key Informant
DEMOGRAPHIC PROFILE
The 2010 census population for LaSalle Parish was 14,890, comprising 4.2% of the nine-parish Rapides Foundation Service Area:

**Population Distribution of the RFSA**
(2010 Population)

- Rapides Parish 131,613
- Avoyelles Parish 42,073
- Vernon Parish 52,334
- Natchitoches Parish 39,566
- Allen Parish 25,764
- Grant Parish 22,309
- Winn Parish 15,313
