INTRODUCTION
Project Overview

Project Goals

This Community Health Needs Assessment — a follow-up to similar research conducted in the area in 2002, 2005 and 2010 — is a systematic, data-driven approach to determining the health status, behaviors and needs of residents in Vernon Parish. Subsequently, this information may be used to inform decisions and guide efforts to improve community health and wellness.

Community Defined for This Assessment

This report focuses on data specific to Vernon Parish, Louisiana, but this study is part of a larger study across the nine-parish Rapides Foundation Service Area (RFSA) in Central Louisiana. Data for the RFSA are also provided throughout this report.

Methodology

2013 PRC Community Health Survey

Survey Instrument

The survey instrument used for this study is based largely on the Centers for Disease Control and Prevention (CDC) Behavioral Risk Factor Surveillance System (BRFSS), as well as various other public health surveys and customized questions addressing gaps in indicator data relative to health promotion and disease prevention objectives and other recognized health issues. The final survey instrument was developed by The Rapides
Foundation and Professional Research Consultants (PRC), and is similar to the previous surveys used in the region, allowing for data trending.

Sample Approach & Design

A precise and carefully executed methodology is critical in asserting the validity of the results gathered in the 2013 PRC Community Health Survey. Thus, to ensure the best representation of the population surveyed, a telephone interview methodology (which includes both landlines and cell phones) was employed. The primary advantages of telephone interviewing are timeliness, efficiency and random-selection capabilities.

The sample design used for this effort consisted of a random sample of 401 adults age 18 and older in Vernon Parish. In total, 3,742 surveys were completed across the Rapides Foundation Service Area; once these data were collected, the sample was weighted in proportion to the actual population distribution at the parish level so that estimates better reflect the region as a whole. Population estimates were based on census data of adults age 18 and over provided through GeoLytics Demographic Estimates and Projections.

All administration of the surveys, data collection and data analysis was conducted by Professional Research Consultants, Inc. (PRC).

Sampling Error

For statistical purposes, the maximum rate of error associated with a sample size of 401 respondents is ±4.9% at the 95 percent level of confidence.

Expected Error Ranges for a Sample of 401 Respondents at the 95 Percent Level of Confidence

Note: ● The "response rate" (the percentage of a population giving a particular response) determines the error rate associated with that response.

Examples: ● If 10% of the sample of 3,742 respondents answered a certain question with a "yes," it can be asserted that between 7.1% and 12.9% (10% ± 2.9%) of the total population would offer this response.

● If 50% of respondents said "yes," one could be certain with a 95 percent level of confidence that between 45.1% and 54.9% (50% ± 4.9%) of the total population would respond "yes" if asked this question.
To accurately represent the population studied, PRC strives to minimize bias through application of a proven telephone methodology and random-selection techniques. And, while this random sampling of the population produces a highly representative sample, it is a common and preferred practice to "weight" the raw data to improve this representativeness even further. This is accomplished by adjusting the results of a random sample to match the demographic characteristics of the population surveyed (poststratification), so as to eliminate any naturally occurring bias. Specifically, once the raw data are gathered, respondents are examined by key demographic characteristics (namely gender, age, race, ethnicity, and poverty status) and a statistical application package applies weighting variables that produce a sample which more closely matches the population for these characteristics. Thus, while the integrity of each individual’s responses is maintained, one respondent’s responses may contribute to the whole the same weight as, for example, 1.1 respondents. Another respondent, whose demographic characteristics may have been slightly oversampled, may contribute the same weight as 0.9 respondents.

The following chart outlines the characteristics of the Vernon Parish sample for key demographic variables, compared to actual population characteristics revealed in census data. [Note that the sample consisted solely of area residents age 18 and older; data on children were given by proxy by the person most responsible for that child’s healthcare needs, and these children are not represented demographically in this chart.]

Further note that the poverty descriptions and segmentation used in this report are based on administrative poverty thresholds determined by the US Department of Health & Human Services. These guidelines define poverty status by household income level and number of persons in the household (e.g., the 2013 guidelines – the most current available – place the poverty threshold for a family of four at $23,550 annual household income or lower). In sample segmentation: “Very Low/Low Income” refers to community members living in a household with defined poverty status or just above the poverty level, earning up to twice the poverty threshold; and “Middle/High Income” refers to households with incomes more than twice the poverty threshold defined for the household size.
The sample design and the quality control procedures used in the data collection ensure that the sample is representative. Thus, the findings may be generalized to the total population of community members in the defined area with a high degree of confidence.

Public Health, Vital Statistics & Other Data

A variety of existing (secondary) data sources was consulted to complement the research quality of this Community Health Needs Assessment. Data for Vernon Parish were obtained from the following sources (specific citations are included with the graphs throughout this report):

- Agenda for Children/KIDS COUNT Data Center
- Centers for Disease Control & Prevention
- ESRI BIS Demographic Portfolio (Projections Based on the US Census)
- Louisiana Department of Health and Hospitals Office of Public Health
- Louisiana State Center for Health Statistics
- National Center for Health Statistics
- www.countyhealthrankings.org

Benchmark Data

Trending

Similar surveys were administered in the region in 2002, 2005 and 2010 by PRC on behalf of The Rapides Foundation. Trending data, as revealed by comparison to prior results, are provided throughout this report whenever available.

RFSA Risk Factor Data

Regional risk factor data for Central Louisiana (the nine-parish Rapides Foundation Service Area or RFSA) are also provided as an additional benchmark against which to compare local findings.

Louisiana Risk Factor Data

Statewide risk factor data are provided where available as an additional benchmark against which to compare local findings. These data are reported in the most recent BRFSS (Behavioral Risk Factor Surveillance System) Prevalence and Trend Data published by the Centers for Disease Control and Prevention and the US Department of Health & Human Services. NOTE: Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.

Nationwide Risk Factor Data

Nationwide risk factor data, which are also provided in comparison charts, are taken from the 2013 PRC National Health Survey (as well as previous PRC National Health Surveys). The methodological approach for the national study is identical to that employed in this assessment, and these data may be generalized to the US population with a high degree of confidence.
Healthy People 2020 provides science-based, 10-year national objectives for improving the health of all Americans. The Healthy People initiative is grounded in the principle that setting national objectives and monitoring progress can motivate action. For three decades, Healthy People has established benchmarks and monitored progress over time in order to:

- Encourage collaborations across sectors.
- Guide individuals toward making informed health decisions.
- Measure the impact of prevention activities.

Healthy People 2020 is the product of an extensive stakeholder feedback process that is unparalleled in government and health. It integrates input from public health and prevention experts, a wide range of federal, state and local government officials, a consortium of more than 2,000 organizations, and perhaps most importantly, the public. More than 8,000 comments were considered in drafting a comprehensive set of Healthy People 2020 objectives.

Key Informant Focus Group

As part of the community health assessment, one focus group was held on March 21, 2013. Focus group participants included 7 key informants: representatives from public health; physicians, other health professionals, social service providers, and other community leaders.

A list of recommended participants for the focus group was provided by the sponsors. Potential participants were chosen because of their ability to identify primary concerns of the populations with whom they work, as well as of the community overall. Participants included a representative of public health, as well as several individuals who work with low-income, minority or other medically underserved populations, and those who work with persons with chronic disease conditions.

Focus group candidates were first contacted by letter to request their participation. Follow-up phone calls were then made to ascertain whether or not they would be able to attend. Confirmation calls were placed the day before the group was scheduled to insure a reasonable turnout.

Audio from the focus group session was recorded, from which verbatim comments in this report are taken. There are no names connected with the comments, as participants were asked to speak candidly and assured of confidentiality.

NOTE: These findings represent qualitative rather than quantitative data. The group was designed to gather input from participants regarding their opinions and perceptions of the health of the residents in the area. Thus, these findings are based on perceptions, not facts.
Information Gaps

While this assessment is quite comprehensive, it cannot measure all possible aspects of health in the community, nor can it adequately represent all possible populations of interest. It must be recognized that these information gaps might in some ways limit the ability to assess all of the community’s health needs.

For example, certain population groups — such as the homeless, institutionalized persons, or those who only speak a language other than English or Spanish — are not represented in the survey data. Other population groups — for example, pregnant women, lesbian/gay/bisexual/transgender residents, undocumented residents, and members of certain racial/ethnic or immigrant groups — might not be identifiable or might not be represented in numbers sufficient for independent analyses.

In terms of content, this assessment was designed to provide a comprehensive and broad picture of the health of the overall community. However, there are certainly a great number of medical conditions that are not specifically addressed.
**Summary of Findings**

**Significant Trends in Vernon Parish**

The following table highlights both positive and negative trends observed in health indicators in comparison with baseline data.

Top Community Health Concerns Among Focus Group Participants

Among Community Key Informants

At the conclusion of the key informant focus group, participants were asked to write down what they individually perceive as the top five health priorities for the community, based on the group discussion as well as on their own experiences and perceptions. Their responses were collected, categorized and tallied to produce the top-ranked priorities as identified among key informants. These should be used to complement and corroborate findings that emerge from the quantitative dataset.

1. Substance Abuse
2. Access to Healthcare Services
3. Obesity (tied)
3. Physical Activity (tied)
3. Education (tied)
3. Smoking (tied)

Comparisons With Benchmark Data

The following tables provide an overview of indicators in Vernon Parish. These data are grouped to correspond with the Focus Areas presented in Healthy People 2020.

Reading the Summary Tables

- In the following charts, Vernon Parish results are shown in the larger, blue column.

- The orange columns to the right of the Vernon Parish column provide comparisons between Vernon Parish and any available regional, state and national findings, as well as Healthy People 2020 targets. Symbols indicate whether Vernon Parish compares favorably (☉), unfavorably (☉), or comparably (☉) to these external data.

- The pink column (far right) provides trending results. Symbols indicate whether Vernon Parish has changed favorably (☉), unfavorably (☉), or is statistically unchanged (☉) compared to baseline data (i.e., the earliest data presented in this report).

ACCESS TO HEALTHCARE SERVICES
Health Insurance Coverage

Survey respondents were asked a series of questions to determine their healthcare insurance coverage, if any, from either private or government-sponsored sources.

Health Insurance Coverage
(Among Adults Age 18 to 64; Vernon Parish, 2013)

A total of 39.7% of Vernon Parish adults age 18 to 64 report having healthcare coverage through private insurance. Another 45.1% report coverage through a government-sponsored program (e.g., Medicaid, Medicare, military benefits).

Hospital & Physician Coverage

Among insured adults, the vast majority (97.0%) are at least partially covered for both physician and hospital visits.

- Statistically similar to the regional (RFSA) prevalence.
- Statistically similar to 2005 survey results. Note that this item was not addressed in the initial 2002 survey.

Aspects of Healthcare Coverage
(Among Insured Adults, Excluding Medicare-Only; 2013)

Survey respondents were asked a series of questions to determine their healthcare insurance coverage, if any, from either private or government-sponsored sources.

NOTE
Trends are measured against baseline data – i.e., the earliest year that data are available.
Prescription Drug Coverage

Among insured adults (excluding those with Medicare), 95.7% report having prescription coverage as part of their insurance plan.

- Statistically similar to the regional (RFSA) prevalence.
- Statistically similar to 2005 survey results.

**Insurance Covers At Least Partial Prescriptions**
(Among Insured Respondents, Excluding Those With Medicare; 2013)

Supplemental Medicare Coverage

Among Medicare recipients, 81.4% report that they have additional supplemental insurance.

- Statistically higher than what was found regionally.
- Statistically higher than the prevalence among Medicare recipients nationwide.

Note that the change in the Vernon Parish trend shown below is not statistically significant, due to the relatively small sample sizes involved.
Lack of Health Insurance Coverage

Among adults age 18 to 64, 15.1% report having no insurance coverage for healthcare expenses.

- More favorable than found regionally.
- More favorable than the state finding.
- Similar to the current national finding.
- The Healthy People 2020 target is universal coverage (0% uninsured).

The prevalence of adults under 65 without healthcare insurance coverage remains statistically unchanged in Vernon Parish since 2002.

The following chart further examines lack of insurance coverage by various key demographic characteristics.

The prevalence is higher among residents living on lower incomes.

**Lack of Healthcare Insurance Coverage**
(Among Vernon Parish Adults Under Age 65, 2013)

**Lack of Healthcare Insurance Coverage**
(Vernon Parish Adults Under 65, 2013)

**NOTE**
In demographic survey charts, “White” and “Black” represent non-Hispanic race categorizations.

Here, lack of health insurance coverage reflects respondents age 18 to 64 (thus, excluding the Medicare population) who have no type of insurance coverage for healthcare services – neither private insurance nor government-sponsored plans (e.g., Medicaid).
Impact of Poor Access

Uninsured adults in Vernon Parish are much less likely to receive routine care and preventive health screenings, and much more likely to encounter healthcare access difficulties.

Notes: Asked of all respondents.
Access to quality care is important to eliminate health disparities and increase the quality and years of healthy life for all persons in the United States. Access to high-quality healthcare across each of the components in the continuum of care must be improved to realize the full potential of prevention. For example, success in reducing the burden of heart disease and narrowing the gap in heart disease outcomes between different racial groups will depend on several factors. These factors include ensuring access to clinical preventive services, such as blood pressure and cholesterol screening; effective primary care to educate people about modifiable risk factors, such as smoking, and to manage effectively chronic conditions like hypertension; high-quality emergency services to improve outcomes of acute cardiac events; and access to rehabilitative and long-term care for heart disease patients.

Improving access to appropriate preventive care requires addressing many barriers, including those that involve the patient, provider, and system of care. Patient barriers include lack of knowledge, skepticism about the effectiveness of prevention, lack of a usual source of primary care, and lack of money to pay for preventive care. Having health insurance, a high income, and a primary care provider are strong predictors that a person will receive appropriate preventive care.

Difficulties Accessing Services

A total of 34.3% of Vernon Parish adults report some type of difficulty or delay in obtaining healthcare services in the past year.

- Similar to what was found throughout the RFSA.
- Better than the national figure.
- Statistically unchanged since 2002.

This indicator reflects the percentage of the total population experiencing problems accessing healthcare in the past year, regardless of whether they needed or sought care.
Note that the following demographic groups more often report difficulties accessing healthcare services:

- Very low and low income residents.

### Experienced Difficulties or Delays of Some Kind in Receiving Needed Healthcare in the Past Year (Vernon Parish, 2013)

#### Barriers to Healthcare Access

Of the tested barriers, difficulty getting an appointment impacted the greatest share of Vernon Parish adults (14.6% say that difficulty getting a medical appointment prevented them from obtaining medical care in the past year).

- The proportion of Vernon Parish adults impacted was statistically comparable to the region for each of the tested barriers except cost of prescriptions, which Vernon Parish was more favorable than the region.
- The proportion of Vernon Parish adults impacted was more favorable than the nation for cost of both prescriptions and doctor visits, but was statistically comparable to what was found nationwide for each of the other tested barriers.

### Barriers to Access Have Prevented Medical Care in the Past Year

Sources: 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Items 9-14]
Notes: Asked of all respondents.
Compared to baseline 2002 data, Vernon Parish has remained statistically unchanged for each of the surveyed barriers.

Accessing Healthcare for Children

A total of 0.9% of parents say there was a time in the past year when they needed medical care for their child, but were unable to get it.

- Comparable to what is found throughout the RFSA.
- More favorable than the percentage reported nationwide.
- Marks a significant improvement over time.

Notes:  
- Asked of all respondents with children under 18 at home.

Related Focus Group Findings: Access to Healthcare Services

Many of the key informants participating in the focus group are concerned with access to healthcare, discussing such issues as:

- Barriers to accessing healthcare
- Cost of copays or medication
- Under-insured or uninsured population
- Medicaid reimbursement rate
- Transportation
- Abuse, or reliance on government programs

Focus group participants agree that residents encounter several barriers when trying to access healthcare services in the community. Many residents do not think about long-term health consequences or the importance of preventative healthcare. Key informants agree that many community members avoid accessing healthcare services until they become very ill because of the cost of copays or medication.
Focus group members believe that many residents are also **under-insured or uninsured**, limiting their access to healthcare services. The underinsured population includes the working poor, those individuals who may qualify for employer insurance but the deductibles are too high or the monthly employee cost too much, so they elect to go without. A rural health clinic operates in the parish with sliding-fee schedules. Participants would like to see more clinics because the rural health clinic experiences high demand and staff turnover can be an issue.

“We have a rural health clinic here, but you have to pay $20.00 or they will not see you, plus other charges. They frequently do not have a physician for weeks or months at a time, and the charity hospital system is going to be no more very soon, so these people will have nowhere to go.” — Vernon Parish Key Informant

The Working Clinic in Vernon Parish, offers reduced-cost, or free, office visits and medication to uninsured **working** adults, and operates with volunteer healthcare providers. For more serious medical issues, and those requiring hospitalization, many uninsured and Medicaid residents remain dependent on the Huey P. Long Memorial Hospital. This dependence concerns respondents because the state hospital continues to undergo transitions and funding reductions.

Some residents may qualify for **Medicaid**, but finding a provider who accepts that insurance can prove difficult. Attendees agree that the number of physicians who accept Medicaid has decreased in recent years, due to the low **reimbursement rate**.

**Transportation** can also act as a barrier, with many local families depending on one car for the entire family, and others do not have any personal vehicles. The lack of personal transportation may make getting to even the free clinic impossible.

Many attendees also feel strongly that **abuse, or reliance, of government programs** persist throughout their community, describing scenarios in which residents do not obtain employment and continue to live off government subsidies. Some participants think that the system does not assist individuals with getting off its programs. If residents obtain employment and lose their state benefits, but do not make enough money to afford medication, there is no incentive to obtain employment. A key informant explains her frustrations:

“I know there’s people that do have workman’s comp and they’re legitimately hurt, but it’s unbelievable, the people that we see. They’ll go fall on purpose to get money rather than work. Have somebody rear end you. I don’t know.” — Vernon Parish Key Informant
Primary Care Services

Improving primary care across the nation depends in part on ensuring that people have a usual source of care. Having a primary care provider as the usual source of care is especially important because of the beneficial attributes of primary care. These benefits include the provision of integrated, accessible healthcare services by clinicians who are accountable for addressing a large majority of personal healthcare needs, developing a sustained partnership with patients, and practicing in the context of family and community. Increasing the number and proportion of members of underrepresented racial and ethnic groups who are primary care providers also is important because they are more likely to practice in areas where health services are in short supply and in areas with high percentages of underrepresented racial and ethnic populations.

Specific Source of Ongoing Care

A total of 77.8% of Vernon Parish adults were determined to have a specific source of ongoing medical care.

- Similar to regional (RFSA) findings.
- Statistically similar to national findings.
- Fails to satisfy the Healthy People 2020 target.
- Statistically unchanged in Vernon Parish since 2005.

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 210]
- 2013 PRC National Health Survey, Professional Research Consultants.

Notes:
- Asked of all respondents.
When viewed by demographic characteristics, the following population segments are less likely to have a specific source of care:

- Adults under age 65, especially young adults 18 to 39.

Medically Underserved Areas/Populations (MUAs/MUPs)

Medically Underserved Areas/Populations are areas or populations designated by the U.S. Department of Health and Human Services Health Resources and Services Administration (HRSA) as having: too few primary care providers; high infant mortality; high poverty; and/or high elderly population.

Note in the following map that each of the nine parishes in the Rapides Foundation Service Area — including Vernon Parish — is designated as a Medically Underserved Area/Population.

Source: http://new.dhh.louisiana.gov/index.cfm/page/763

Health Professional Shortage Areas: Primary Care

Health Professional Shortage Area (HPSA) designations are approved by the federal Office of Shortage Designation (OSD) in the Health Resources and Services Administration (HRSA) located in Rockville, Maryland. Louisiana’s Bureau of Primary Care and Rural Health (BPCRH) typically submits requests pertaining to areas within the state. Designated HPSAs are valid for three years and are reviewed in the last year. Upon review, if the area continues to qualify, an updated request is submitted to OSD.

Several assistance programs use HPSA designations as a requirement when approving grants and other funding. These include J-1 Visa Waivers, National Health Service Corps Scholar and Loan Repayment Programs, Louisiana’s State Loan Repayment Program, the 10% Bonus Medicare Incentive Program (geographic HPSAs only), designating rural health clinics (RHCs) and federally qualified health centers (FQHCs), and several grants.

**Primary Care** designations pertain to an area’s access to physicians that practice principally in one of the following: family practice, general practice, internal medicine, pediatrics, and OB/GYN. A ratio is used to measure the level of primary care access. To be
considered underserved a ratio of $\geq 3,500$ possible patients to one (1) primary care physician FTE (full-time equivalent) is usually required. The ratio is 3,000:1 for High Needs (High Needs is used if the 200% Federal Poverty Level for the area is over 20%). Provider FTEs are determined by taking the number of hours per week the physician spends in primary care services, either in-office or on-rounds at the hospital, divided by 40. The total of these FTEs is divided by the total resident/civilian population of the area.

For each of the three HPSA Designation types, there are three sub-categories, which include:

- **Geographic designations**—these take into account the entire population of the requested area to all available primary care physicians.

- **Population Group designations**—these are special groups. The most common of these are Low Income and Medicaid-Eligible designations. Low income designations use a ratio built upon the low income population of the area and the physicians providing services to this population. Medicaid-eligible designations are based on the number of Medicaid-eligible people and the physicians that accept Medicaid.

- **Facility designations**—these look at a facility’s outpatient census, waiting times, patients’ residences and in-house faculty to evaluate a facility’s designation eligibility.

Vernon Parish is a geographically designated HPSA.

![Primary Care HPSA Map of Louisiana](http://new.dhh.louisiana.gov/assets/oph/pcrh/10-03-2012_PC_MAP.jpg)

Degree of shortage is based on the ratio of the relevant population to one (1) full time equivalency (FTE) primary care physician.
Vision Care

A total of 54.2% of Vernon Parish adults have had an eye exam in the past two years during which their pupils were dilated.

- Similar to regional (RFSA) findings.
- Similar to national findings.
- Marks a significant improvement from 2002 survey findings.

Had an Eye Exam in the Past Two Years During Which the Pupils Were Dilated

![Bar chart showing vision care by region and year]

Recent vision care is less often reported among:

- Men
- Adults under age 65, especially those age 18 to 39 (note positive correlation with age).

Had an Eye Exam in the Past Two Years During Which the Pupils Were Dilated

(Vernon Parish, 2013)

![Bar chart showing vision care by demographic groups]
Dental Care

Adults

A total of 56.3% of Vernon Parish adults have visited a dentist or dental clinic within the past year.

- Similar to regional (RFSA) findings.
- Lower than found statewide.
- Lower than found nationally.
- Satisfies the Healthy People 2020 goal (49.0% or higher).

Dental care in Vernon Parish has worsened since 2002.

Have Visited a Dentist or Dental Clinic Within the Past Year

Healthy People 2020 Target = 49.0% or Higher

Sources:
- 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 22]
- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.
Recent dental care in the service area is less often reported among adults age 40 plus.

Very low and low income residents.

**Have Visited a Dentist or Dental Clinic Within the Past Year**
(Vernon Parish, 2013)

Children

A total of 83.4% of Vernon Parish parents report that their child (age 2 to 17) has been to a dentist or dental clinic within the past year.

- Similar to regional (RFSA) findings.
- Similar to national findings.
- Satisfies the Healthy People 2020 goal (49.0% or higher).
- Statistically worsened over time.
Health Professional Shortage Area (HPSA) designations are approved by the federal Office of Shortage Designation (OSD) in the Health Resources and Services Administration (HRSA) located in Rockville, Maryland. Louisiana’s Bureau of Primary Care and Rural Health (BPCRH) typically submits requests pertaining to areas within the state. Designated HPSAs are valid for three years and are reviewed in the last year. Upon review, if the area continues to qualify, an updated request is submitted to OSD.

**Dental** designations (like primary care designations) are approved by the Shortage Designation Branch. These are designated on a similar ratio scheme. Dental FTEs are calculated by starting with the number of hours of patient care worked per week provided by the dentist. The FTE is then weighted according to the dentist’s age and number of in-house assistants the dentist employs. A ratio of ≥5,000 possible patients to one (1) dentist FTE is required or 4,000:1 for High Needs areas.

For each of the three HPSA Designation types, there are three sub-categories, which include:

- **Geographic designations**—these take into account the entire population of the requested area to all available dentists.
- **Population Group designations**—these are special groups. The most common of these are Low Income and Medicaid-Eligible designations. Low income designations use a ratio built upon the low income population of the area and the physicians providing services to this population. Medicaid-eligible designations are based on the number of Medicaid-eligible people and the physicians that accept Medicaid.
- **Facility designations**—these look at a facility’s outpatient census, waiting times, patients’ residences and in-house faculty to evaluate a facility’s designation eligibility.

**Vernon Parish is a geographically designated HPSA for dental care.**
Healthcare Information Sources

According to survey data, family physicians and the Internet are residents’ primary sources of healthcare information.

- 46.6% of adults cited their family physician as their primary source of healthcare information.
- 19.2% of adults cited the Internet as their primary source of healthcare information.

**Notes:** ● Asked of all respondents.

**Related Focus Group Findings: Health Education & Prevention**

Focus group attendees agree that health education is a critical component in creating and maintaining healthy lifestyles. Primary concerns among participants include:

- Importance of preventative healthcare
- Complacency
- Cultural traditions

Focus group participants agree that health education is an important aspect of prevention and improving the overall health of community members. Current programming occurs at health fairs or through healthcare providers; however, residents do not value preventative healthcare services. Many residents think that if they feel “fine,” then they do not need to visit a healthcare provider, for a routine check-up.

“A certain population that I see that I’m doing their blood pressure, they don’t come in for that, but I just do it and you’d be surprised. One guy’s was like 180/110 and he said, ’I feel fine. I’ve never had trouble with my blood pressure.’ Well, you do now.” — Vernon Parish Key Informant

Residents also participate in unhealthy activities because they do not know any better, and attendees question whether residents are interested in learning to be healthier. The high level of complacency in the community makes it difficult to engage residents. A participant explains this reality:
“I’m not convinced that the adult populations thinks enough about good health, eating habits, and so forth and can translate that to the kids and so they grow up doing the same things their parents did.” — Vernon Parish Key Informant

Additional barriers to good health stem from **cultural traditions** and participants worry that the culture is not shifting in a positive direction:

“Vernon Parish is sandwiched between those two cultures (Duck Dynasty and Swamp People) and the culture is its okay to be a hillbilly. It’s cool to be a redneck and the culture that goes along with it, so these things are being broadcast. Hey, this is Louisiana all over, and that’s the way people think of us probably north of Arkansas, wrestling alligators.” — Vernon Parish Key Informant
Emergency Room Services

A total of 10.1% of adults throughout Vernon Parish have gone to a hospital emergency room more than once in the past year about their own health.

- Similar to the regional (RFSA) prevalence.
- Similar to the national prevalence.
- Statistically unchanged from the previous findings.

Have Used a Hospital Emergency Room More Than Once in the Past Year

Among those residents reporting recent use of the ER, 43.3% mentioned that it was an emergency situation, while 39.4% used the ER because it was a weekend or after-hours and 12.5% cited various access issues.

When asked why they used the ER instead of a doctor’s office, 43.3% say this was due to an emergency or life-threatening situation (lower than the 67.5% reported nationally), while 39.4% indicated that the visit was during after-hours or on the weekend (higher than the 17.9% across the US) and 12.5% cited some type of primary care access barrier (higher than the 6.2% nationally).

Note that multiple ER visits were most often noted among:

- Women.
- Very low and low income residents.
Have Used a Hospital Emergency Room
More Than Once in the Past Year
(Vernon Parish, 2013)

Sources:
- 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 23]

Notes:
- Asked of all respondents.
- Income categories reflect respondent’s household income as a ratio to the federal poverty level for their household size: very low income” = below poverty; “low income” = 100% to 200% of poverty; “middle/high income” = over 200% of poverty.
DEATH & DISABILITY
Leading Causes of Death

Distribution of Deaths by Cause

Together, cardiovascular disease (including both heart disease and stroke) and cancers accounted for over one-half of all deaths in Vernon Parish between 2008 and 2010.

- Note the particularly high proportion of Vernon Parish deaths attributed to cancer when compared to the region, state, and US overall.

Leading Causes of Death
(2008-2010)

The following chart shows crude mortality (death) rates by age groups in Vernon Parish, in comparison with state and national rates. Crude death rates represent the number of deaths in relation to the population size (such as deaths per 100,000 population, as is used here).

- Compared to region, state and national rates, Vernon Parish mortality rates among most age groups are similar.
- Infant deaths (under age 1) are also notably lower compared to the region and state.
In addition, the following table provides a breakout of the top three leading causes of death by age group in the Rapides Foundation Service Area between 2008 and 2010 (note that this level of detail is not available at the parish level).

- Note that accidents are the leading cause of death in RFSA residents age 1 to 44; past age 44, cardiovascular disease (heart disease and stroke) emerge as the leading cause of death.

Age-Adjusted Death Rates: All Causes

In order to compare rates among localities (parish to parish, as well as against Louisiana and United States rates) without undue bias toward younger or older populations, the common convention is to adjust the data to some common baseline age distribution. Use of these "age-adjusted" rates provides the most valuable means of gauging mortality against benchmark data, as well as Healthy People 2020 targets.

**Between 2008-2010, there was an annual average of 910.5 age-adjusted deaths per 100,000 population.**

- Similar to the RFSA rate.
- Similar to the Louisiana rate.
- Well above the national mortality rate.

Notes: Deaths from 1999 forward are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10); pre-1999 data were coded using ICD-9 coding. Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population. State and national data are simple three-year averages; the RFSA three-year average is weighted by population. NOTE: 2006-2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.
Age-Adjusted Death Rates for Selected Causes

The following chart outlines 2008-2010 annual average age-adjusted death rates per 100,000 population for selected causes of death in Vernon Parish.

Note that 6 of the top 7 causes of death in Vernon Parish are worse than US rates (stroke is the only exception).

All of the top 7 causes of death in Vernon Parish also fail to meet the available Healthy People 2020 objectives (with the exception of CLRD which does not have a HP2020 target).

Sources:
- CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted July 2013.

Note:
- Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population and coded using ICD-10 codes.
- Parish, state and national data are simple three-year averages, the RFSA three-year averages are weighted by population.
- Due to low numbers of deaths, Vernon Parish cirrhosis, drug-induced, and homicide rates represent 2001-2010 data; the pneumonia/influenza rate represents 2006-2010 data.
- The Healthy People 2020 Heart Disease target is adjusted to account for all diseases of the heart; the Diabetes target is adjusted to reflect only diabetes mellitus-coded deaths.

Years of Potential Life Lost (YPLL)

According to County Health Rankings (www.countyhealthrankings.org):

YPLL is a widely used measure of the rate and distribution of premature mortality. The measure was introduced mainly because simple mortality rates do not fully address the issue of premature death, the impact of disease and death, and their cost to society.

YPLL emphasizes deaths of younger persons, whereas statistics that include all mortality are dominated by deaths of the elderly. For example, using YPLL-75, a death at age 55 counts twice as much as a death at age 65, and a death at age 35 counts eight times as much as a death at age 70. Including all mortality instead of YPLL could draw attention to areas with higher mortality rates among the oldest segment of the population, where there may be little that can be done to change chronic health problems that have developed over many years.

YPLL is not without weaknesses. The measure can be difficult for lay people and public health practitioners to interpret. Further, deaths that occur after the age limit are not
accounted for at all. Because of this, YPLL can fail to completely capture the burden of chronic disease, especially if the age cut-off is set too low.

In Vernon Parish in 2008-2009, there was an age-adjusted rate of 8,453 years of potential life lost (before age 75) per 100,000 population.

- Below the statewide YPLL rate.
- Well above the national YPLL rate.

Sources:
- National Center for Health Statistics and County Health Rankings: www.countyhealthrankings.org

Notes:
- Premature death is represented by the years of potential life lost before age 75 (YPLL-75). Every death occurring before the age of 75 contributes to the total number of years of potential life lost. For example, a person dying at age 25 contributes 50 years of life lost, whereas a person who dies at age 65 contributes 10 years of life lost to a parish's YPLL. The YPLL measure is presented as a rate per 100,000 population and is age-adjusted to the 2000 US population.
- *US Benchmark is the 90th percentile among all US states.
Cardiovascular Disease

Heart disease and stroke—the principal components of cardiovascular disease—are leading causes of death in the United States.

- About 950,000 adults die of heart disease or stroke each year, which amounts to one death every 33 seconds.
- Although heart disease and stroke are often thought to affect men and older people primarily, it is also a major killer of women and people in the prime of life. More than half of those who die of heart disease or stroke each year are women.
- Each year, about 63 of every 100,000 deaths are due to stroke.

Looking at only deaths due to heart disease or stroke, however, understates the health effects of these two conditions:

- About 61 million adults (almost one-fourth of the population) live with the effects of stroke or heart disease.
- Heart disease is a leading cause of disability among working adults.
- Stroke alone accounts for the disability of more than 1 million adults.
- Almost 6 million hospitalizations each year are due to heart disease or stroke.
- About 4.5 million stroke survivors are alive today.

The economic effects of heart disease and stroke on the US healthcare system grow larger as the population ages. In 2001, for example, the [nationwide] cost for all cardiovascular diseases was $300 billion: for heart disease the cost was $105 billion; for stroke, $28 billion. Lost productivity due to stroke and heart disease cost more than $129 billion.

– National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

Age-Adjusted Heart Disease & Stroke Deaths

Heart Disease Deaths

Between 2008 and 2010, there was an annual average age-adjusted heart disease mortality rate of 259.3 deaths per 100,000 population in Vernon Parish.

- Similar to the regional rate.
- Higher than found statewide.
- Much higher than the national rate.
- Fails to satisfy the Healthy People 2020 objective (adjusted to account for all diseases of the heart).
Heart Disease: Age-Adjusted Mortality
(2008-2010 Annual Average Deaths per 100,000 Population)

Sources:
- CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted July 2013.

Notes:
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
- The Healthy People 2020 Heart Disease target is adjusted to account for all diseases of the heart.
- NOTE: 2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.

By race, the age-adjusted heart disease mortality rate is higher among Blacks in Vernon Parish.

Heart Disease: Age-Adjusted Mortality by Race
(2008-2010 Annual Average Deaths per 100,000 Population)

- 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 158]
- Asked of all respondents.
- Income categories reflect respondent's household income as a ratio to the federal poverty level for their household size: very low income = below poverty; low income = 100% to 200% of poverty; middle/high income = over 200% of poverty.

Notes:
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.
Cardiovascular Risk Factors

Hypertension (High Blood Pressure)

High blood pressure is known as the “silent killer” and remains a major risk factor for coronary heart disease, stroke, and heart failure. About 50 million adults in the United States have high blood pressure.

High Blood Pressure Testing

A total of 96.4% of Vernon Parish adults have had their blood pressure tested within the past two years.

- Similar to regional findings.
- Higher than national findings.
- Satisfies the Healthy People 2020 target.

Hypertension screening has remained statistically unchanged in Vernon Parish over time.

Have Had Blood Pressure Checked in the Past 2 Years

Healthy People 2020 Target = 92.6% or Higher

Prevalence of Hypertension

A full 39.0% of adults have been told at some point that their blood pressure was high (an additional 1.5% have not been tested in the past five years).

- More favorable than the RFSA prevalence.
- Similar to the Louisiana prevalence.
- Similar to the national prevalence.
- Fails to satisfy the Healthy People 2020 target.

Since 2002, the Vernon Parish prevalence of hypertension has increased significantly.

Note that 76.2% of hypertensive residents have been diagnosed more than once.
Prevalence of High Blood Pressure

Notes: ● Asked of all respondents who have been diagnosed with high blood pressure.
● In this case, the term “action” refers to medication, change in diet, and/or exercise.

High Blood Cholesterol

High blood cholesterol is a major risk factor for coronary heart disease that can be modified. More than 50 million US adults have blood cholesterol levels that require medical advice and treatment. More than 90 million adults have cholesterol levels that are higher than desirable. Experts recommend that all adults age 20 years and older have their cholesterol levels checked at least once every 5 years to help them take action to prevent or lower their risk of coronary heart disease. Lifestyle changes that prevent or lower high blood cholesterol include eating a diet low in saturated fat and cholesterol, increasing physical activity, and reducing excess weight.

Blood Cholesterol Testing

A total of 83.3% of Vernon Parish adults have had their blood cholesterol checked within the past five years.

- Similar to regional findings.
- More favorable than Louisiana findings.
- Similar to the national percentage.
- Similar to the Healthy People 2020 target.
- Since 2002, the prevalence of Vernon Parish adults with recent cholesterol screenings has remained statistically unchanged.
Have Had Blood Cholesterol Levels Checked in the Past 5 Years

Healthy People 2020 Target = 82.1% or Higher

The following demographic segments report a lower prevalence of recent cholesterol screenings:

- Men.
- Young adults (age 18 to 39).
- Whites.

Self-Reported High Blood Cholesterol

More than one-fourth (28.1%) of adults have been told by a health professional that their cholesterol level was high (an additional 22.5% have not had their cholesterol tested in the past five years).

- More favorable than regional findings.
- More favorable than Louisiana findings.
- Similar to the national prevalence.
- More than twice the Healthy People 2020 target.
- Since 2002, the Vernon Parish prevalence of high cholesterol has increased significantly.

Taking Action to Control High Blood Cholesterol Levels
(Among Vernon Parish Adults with High Cholesterol, 2013)

Total Cardiovascular Risk

Individual level risk factors which put people at increased risk for cardiovascular diseases include:

- High Blood Pressure
- High Blood Cholesterol
- Tobacco Use
- Physical Inactivity
- Poor Nutrition
- Overweight/Obesity
- Diabetes

Three health-related behaviors contribute markedly to cardiovascular disease:

Poor nutrition. People who are overweight have a higher risk for cardiovascular disease. Almost 60% of adults are overweight or obese. To maintain a proper body weight, experts recommend a well-balanced diet which is low in fat and high in fiber, accompanied by regular exercise.

Lack of physical activity. People who are not physically active have twice the risk for heart disease of those who are active. More than half of adults do not achieve recommended levels of physical activity.

Tobacco use. Smokers have twice the risk for heart attack of nonsmokers. Nearly one-fifth of all deaths from cardiovascular disease, or about 190,000 deaths a year nationally, are smoking-related. Every day, more than 3,000 young people become daily smokers in the US.

Modifying these behaviors is critical both for preventing and for controlling cardiovascular disease. Other steps that adults who have cardiovascular disease should take to reduce their risk of death and disability
include adhering to treatment for high blood pressure and cholesterol, using aspirin as appropriate, and learning the symptoms of heart attack and stroke.

– National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

A total of 89.1% of Vernon Parish adults report one or more cardiovascular risk factors, such as being overweight, smoking cigarettes, being physically inactive, or having high blood pressure or cholesterol.

- Similar to regional findings.
- Less favorable than national findings.
- No change from 2002 survey findings.

**Present One or More Cardiovascular Risks or Behaviors**

**Sources:**
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 161]
- 2013 PRC National Health Survey, Professional Research Consultants.

**Notes:**
- Asked of all respondents.
- Cardiovascular risk is defined as exhibiting one or more of the following: 1) no leisure-time physical activity; 2) regular/occasional cigarette smoking; 3) hypertension; 4) high blood cholesterol; and/or 5) being overweight/obese.

Adults more likely to exhibit cardiovascular risk factors include:

- Adults age 40 and older.

**Present One or More Cardiovascular Risks or Behaviors**

(Vernon Parish, 2013)

![Chart showing cardiovascular risk factors by gender, age group, income, and race for Vernon Parish]
Cancer, the second-leading cause of death among adults, is responsible for one of every four deaths in the United States. In 2003, over half a million adults—or more than 1,500 people a day—will die of cancer. Black adults are more likely to die from cancer than people of any other racial or ethnic group.

The financial costs of cancer are staggering. According to the National Institutes of Health, cancers cost the United States more than $170 billion in 2002. This includes more than $110 billion in lost productivity and over $60 billion in direct medical costs.

The number of new cancer cases can be reduced substantially, and many cancer deaths can be prevented. Healthier lifestyles can significantly reduce a person’s risk for cancer—for example, avoiding tobacco use, increasing physical activity, improving nutrition, and avoiding sun exposure. Making cancer screening and information services available and accessible to all adults is also essential for reducing the high rates of cancer and cancer deaths. Screening tests for breast, cervical, and colorectal cancers reduce the number of deaths from these diseases by finding them early, when they are most treatable. Screening tests for cervical and colorectal cancers can actually prevent these cancers from developing by detecting treatable precancerous conditions.

— National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

Age-Adjusted Cancer Deaths

Between 2008 and 2010, there was an annual average age-adjusted cancer mortality rate of 237.0 deaths per 100,000 population in Vernon Parish.

- Less favorable than the rate found for the RFSA.
- Less favorable than the rate reported across Louisiana.
- Less favorable than the national rate.
- Far from satisfying the Health People 2020 target.

Cancer: Age-Adjusted Mortality
(2008-2010 Annual Average Deaths per 100,000 Population)

Healthy People 2020 Target = 160.6 or Lower
Unlike the region, state and US, cancer deaths are higher among Whites than among Blacks in Vernon Parish.

The Vernon Parish cancer mortality rate has trended upward in recent years.
Cancer Deaths by Site

LUNG CANCER

Lung cancer is the most common cause of cancer death among both females and males in the United States. Cigarette smoking is the most important risk factor for lung cancer, accounting for 68 to 78 percent of lung cancer deaths among females and 88 to 91 percent of lung cancer deaths among males. Other risk factors include occupational exposures (radon, asbestos) and indoor and outdoor air pollution (radon, environmental tobacco smoke). One to two percent of lung cancer deaths are attributable to air pollution. After 10 years of abstinence, smoking cessation decreases the risk of lung cancer to 30 to 50 percent of that of continuing smokers.

Lung cancer is by far the leading cause of cancer deaths in Vernon Parish.

Other leading sites include prostate cancer in men, breast cancer in women, and colorectal cancer (both genders).

As can be seen in the following chart (referencing 2008-2010 annual average age-adjusted death rates):

- Lung cancer rates in Vernon Parish are less favorable than the respective regional, state and national rates.
- The Vernon Parish prostate, female breast and colorectal cancer death rates are each comparable to the respective regional, state and national rates.

Note that of these Vernon Parish rates, only the female breast cancer rate satisfies the related Healthy People 2020 objectives.

Notes: ● Asked of all respondents.
Cancer Risk

Reducing the nation’s cancer burden requires reducing the prevalence of behavioral and environmental factors that increase cancer risk.

- All cancers caused by cigarette smoking could be prevented. At least one-third of cancer deaths that occur in the United States are due to cigarette smoking.
- According to the American Cancer Society, about one-third of cancer deaths that occur in the United States each year are due to nutrition and physical activity factors, including obesity.

– National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

Cancer Screenings

The American Cancer Society recommends that both men and women get a cancer-related checkup during a regular doctor’s checkup. It should include examination for cancers of the thyroid, testicles, ovaries, lymph nodes, oral cavity, and skin, as well as health counseling about tobacco, sun exposure, diet and nutrition, risk factors, sexual practices, and environmental and occupational exposures.

Screening levels in the community were measured in the 2013 Community Health Survey relative to four cancer sites: prostate cancer (prostate-specific antigen testing and digital rectal examination); female breast cancer (mammography); cervical cancer (Pap smear testing); and colorectal cancer (sigmoidoscopy and fecal occult blood testing).

Prostate Cancer Screenings

PROSTATE CANCER

Prostate cancer is the most commonly diagnosed form of cancer (other than skin cancer) in males and the second leading cause of cancer death among males in the United States. Prostate cancer is most common in men age 65 years and older, who account for approximately 80 percent of all cases of prostate cancer.

Digital rectal examination (DRE) and the prostate-specific antigen (PSA) test are two commonly used methods for detecting prostate cancer. Although several treatment alternatives are available for prostate cancer, their impact on reducing death from prostate cancer when compared with no treatment in patients with operable cancer is uncertain. Efforts aimed at reducing deaths through screening and early detection remain controversial because of the uncertain benefits and potential risks of screening, diagnosis, and treatment.

The US Preventive Services Task Force (USPSTF) concludes that the current evidence is insufficient to assess the balance of benefits and harms of prostate cancer screening in men younger than age 75 years.

Rationale: Prostate cancer is the most common nonskin cancer and the second-leading cause of cancer death in men in the United States. The USPSTF found convincing evidence that prostate-specific antigen (PSA) screening can detect some cases of prostate cancer.

In men younger than age 75 years, the USPSTF found inadequate evidence to determine whether treatment for prostate cancer detected by screening improves health outcomes compared with treatment after clinical detection.

The USPSTF found convincing evidence that treatment for prostate cancer detected by screening causes moderate-to-substantial harms, such as erectile dysfunction, urinary incontinence, bowel dysfunction, and death. These harms are especially important because some men with prostate cancer who are treated would never have developed symptoms related to cancer during their lifetime.
There is also adequate evidence that the screening process produces at least small harms, including pain and discomfort associated with prostate biopsy and psychological effects of false-positive test results.

The USPSTF recommends against screening for prostate cancer in men age 75 years or older.

**Rationale:** In men age 75 years or older, the USPSTF found adequate evidence that the incremental benefits of treatment for prostate cancer detected by screening are small to none.

Given the uncertainties and controversy surrounding prostate cancer screening in men younger than age 75 years, a clinician should not order the PSA test without first discussing with the patient the potential but uncertain benefits and the known harms of prostate cancer screening and treatment. Men should be informed of the gaps in the evidence and should be assisted in considering their personal preferences before deciding whether to be tested.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.

**PSA Testing and/or Digital Rectal Examination**

Among men age 50 and older, three in four (75.8%) have had a PSA (prostate-specific antigen) test and/or a digital rectal examination for prostate problems within the past two years.

- Similar to regional findings.
- Comparable to national findings.
- Statistically unchanged over time.

**Female Breast Cancer Screening**

**FEMALE BREAST CANCER**

Breast cancer is the most common cancer [diagnosis] among women in the United States. Death from breast cancer can be reduced substantially if the tumor is discovered at an early stage. Mammography is the most effective method for detecting these early malignancies. Clinical trials have demonstrated that mammography screening can reduce breast cancer deaths by 20 to 39 percent in women age 50 to 74 years and about 17 percent in women age 40 to 49 years. Breast cancer deaths can be reduced through increased adherence with recommendations for regular mammography screening.

Many breast cancer risk factors, such as age, family history of breast cancer, reproductive history, mammographic densities, previous breast disease, and race and ethnicity, are not subject to intervention. However, being overweight is a well-established breast cancer risk for postmenopausal women that can be
addressed. Avoiding weight gain is one method by which older women may reduce their risk of developing breast cancer.

The US Preventive Services Task Force (USPSTF) recommends screening mammography, with or without clinical breast examination (CBE), every 1-2 years for women age 40 and older.

**Rationale:** The USPSTF found fair evidence that mammography screening every 12-33 months significantly reduces mortality from breast cancer. Evidence is strongest for women age 50-69, the age group generally included in screening trials. For women age 40-49, the evidence that screening mammography reduces mortality from breast cancer is weaker, and the absolute benefit of mammography is smaller, than it is for older women. Most, but not all, studies indicate a mortality benefit for women undergoing mammography at ages 40-49, but the delay in observed benefit in women younger than 50 makes it difficult to determine the incremental benefit of beginning screening at age 40 rather than at age 50.

The absolute benefit is smaller because the incidence of breast cancer is lower among women in their 40s than it is among older women. The USPSTF concluded that the evidence is also generalizable to women age 70 and older (who face a higher absolute risk for breast cancer) if their life expectancy is not compromised by comorbid disease. The absolute probability of benefits of regular mammography increase along a continuum with age, whereas the likelihood of harms from screening (false-positive results and unnecessary anxiety, biopsies, and cost) diminish from ages 40-70. The balance of benefits and potential harms, therefore, grows more favorable as women age. The precise age at which the potential benefits of mammography justify the possible harms is a subjective choice. The USPSTF did not find sufficient evidence to specify the optimal screening interval for women age 40-49.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.

**Mammography**

*Among women age 50 to 74, 65.4% have had a mammogram within the past two years.*

- Similar to regional findings.
- Lower than the statewide figure (which represents all women 50 and older).
- Lower than national findings.
- Fails to satisfy the Healthy People 2020 target.

Since 2002, the prevalence of Vernon Parish women age 50 to 74 who received a mammogram in the past two years has decreased significantly.
Among women 40 and older, 63.2% had a mammogram in the past two years.

Cervical Cancer Screenings

CERVICAL CANCER

The US Preventive Services Task Force (USPSTF) strongly recommends screening for cervical cancer in women who have been sexually active and have a cervix.

Rationale: The USPSTF found good evidence from multiple observational studies that screening with cervical cytology (Pap smears) reduces incidence of and mortality from cervical cancer. Direct evidence to determine the optimal starting and stopping age and interval for screening is limited. Indirect evidence suggests most of the benefit can be obtained by beginning screening within 3 years of onset of sexual activity or age 21 (whichever comes first) and screening at least every 3 years. The USPSTF concludes that the benefits of screening substantially outweigh potential harms.
The USPSTF recommends against routinely screening women older than age 65 for cervical cancer if they have had adequate recent screening with normal Pap smears and are not otherwise at high risk for cervical cancer.

**Rationale:** The USPSTF found limited evidence to determine the benefits of continued screening in women older than 65. The yield of screening is low in previously screened women older than 65 due to the declining incidence of high-grade cervical lesions after middle age. There is fair evidence that screening women older than 65 is associated with an increased risk for potential harms, including false-positive results and invasive procedures. The USPSTF concludes that the potential harms of screening are likely to exceed benefits among older women who have had normal results previously and who are not otherwise at high risk for cervical cancer.

The USPSTF recommends against routine Pap smear screening in women who have had a total hysterectomy for benign disease.

**Rationale:** The USPSTF found fair evidence that the yield of cytologic screening is very low in women after hysterectomy and poor evidence that screening to detect vaginal cancer improves health outcomes. The USPSTF concludes that potential harms of continued screening after hysterectomy are likely to exceed benefits.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.

**Pap Smear Testing**

**Among women age 21 to 65, 78.5% have had a Pap smear within the past three years.**

- Similar to the regional percentage.
- Similar to the Louisiana percentage, which represents all women 18+.
- Similar to than national findings.
- Fails to satisfy the Healthy People 2020 target.
- Marks a significant decrease over time.

**Have Had a Pap Smear in the Past 3 Years**

(Among Vernon Parish Women Age 21-65, 2013)

![Graph showing Pap Smear screening rates](image-url)
Among women age 18 and older, 74.8% had a Pap smear in the past three years.

Colorectal Cancer Screenings

COLORECTAL CANCER

Colorectal cancer is the third most common type of cancer and the second leading cause of cancer death in the United States. Current levels of screening in this country lag behind those of other effective cancer screening tests; it has been estimated that attainment of goals for population colorectal cancer screening could save 18,800 lives per year. Colorectal cancer incidence and mortality show health disparities, with a disproportionate burden occurring in certain minority populations, including African American adults and Alaska Natives.

The USPSTF recommends screening for colorectal cancer using fecal occult blood testing, sigmoidoscopy, or colonoscopy in adults, beginning at age 50 years and continuing until age 75 years.

The evidence is convincing that screening for colorectal cancer with fecal occult blood testing, sigmoidoscopy, or colonoscopy detects early-stage cancer and adenomatous polyps. There is convincing evidence that screening with any of the three recommended tests (FOBT, sigmoidoscopy, colonoscopy) reduces colorectal cancer mortality in adults age 50 to 75 years. Follow-up of positive screening test results requires colonoscopy regardless of the screening test used.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.

Risk factors for colorectal cancer may include age, personal and family history of polyps or colorectal cancer, inflammatory bowel disease, inherited syndromes, physical inactivity (colon only), obesity, alcohol use, and a diet high in fat and low in fruits and vegetables. Detecting and removing precancerous colorectal polyps and detecting and treating the disease in its earliest stages will reduce deaths from colorectal cancer.

Colorectal Cancer Screening

Among Vernon Parish adults age 50-75, nearly two-thirds (64.5%) have had an appropriate colorectal cancer screening (fecal occult blood testing within the past year and/or sigmoidoscopy/colonoscopy [lower endoscopy] within the past 10 years).

- Similar to regional (RFSA) findings.
- Lower than the national prevalence.
Similar to the Healthy People 2020 target.

**Have Had a Colorectal Cancer Screening**
(Among Adults Age 50-75)

**Sources:**
- 2010 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 168]
- Asked of all respondents age 50 through 75.
- In this case, the term “colorectal screening” refers to adults age 50-75 receiving a FOBT (fecal occult blood test) in the past year and/or a lower endoscopy (sigmoidoscopy/colonoscopy) in the past 10 years.

**Notes:**
- Asked of all respondents age 50 through 75.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.
Blood Stool Testing

Among adults age 50 and older, 26.9% have had a blood stool test (aka “fecal occult blood test”) within the past two years.

- Similar to regional (RFSA) findings.
- More favorable than Louisiana findings.
- Less favorable than national findings.

Since 2002, the prevalence of recent blood stool exams has decreased significantly.

Respiratory Disease

Asthma and COPD (chronic obstructive pulmonary disease) are among the 10 leading chronic conditions causing restricted activity [in adults]. After chronic sinusitis, asthma is the most common cause of chronic illness in children. Methods are available to treat these respiratory diseases and promote respiratory health.

Asthma is a serious and growing health problem. An estimated 14.9 million persons in the United States have asthma. Asthma is responsible for about 500,000 hospitalizations, 5,000 deaths, and 134 million days of restricted activity a year. Yet most of the problems caused by asthma could be averted if persons with asthma and their healthcare providers managed the disease according to established guidelines.

COPD includes chronic bronchitis and emphysema—both of which are characterized by irreversible airflow obstruction and often exist together. Similar to asthma, COPD may be accompanied by an airway hyperresponsiveness. Most patients with COPD have a history of cigarette smoking. COPD worsens over time with continued exposure to a causative agent—usually tobacco smoke or sometimes a substance in the workplace or environment. COPD occurs most often in older people.

Age-Adjusted Respiratory Disease Deaths

Chronic Lower Respiratory Disease Deaths (CLRD)

Between 2008 and 2010, there was an annual average age-adjusted CLRD mortality rate of 56.0 deaths per 100,000 population in Vernon Parish.

- Higher than the regional (RFSA) rate.
- Higher than the statewide rate.
- Higher than the national rate.

CLRD: Age-Adjusted Mortality
(2008-2010* Annual Average Deaths per 100,000 Population)

Note: What was previously termed COPD (chronic obstructive pulmonary disease) has been reclassified as CLRD (chronic lower respiratory disease).
CLRD mortality in Vernon Parish has fluctuated, but is most recently higher than baseline data.

Injury & Violence

The risk of injury is so great that most persons sustain a significant injury at some time during their lives. Nevertheless, this widespread human damage too often is taken for granted, in the erroneous belief that injuries happen by chance and are the result of unpreventable “accidents.” In fact, many injuries are not “accidents,” or random, uncontrollable acts of fate; rather, most injuries are predictable and preventable.

For ages 1 through 44 years, [US] deaths from injuries far surpass those from cancer—the overall leading natural cause of death at these ages—by about three to one. Injuries cause more than two out of five deaths (43 percent) of children age 1 through 4 years and result in four times the number of deaths due to birth defects, the second leading cause of death for this age group. For ages 15 to 24 years, injury deaths exceed deaths from all other causes combined from ages 5 through 44 years. For ages 15 to 24 years, injuries are the cause of nearly four out of five deaths. After age 44 years, injuries account for fewer deaths than other health problems, such as heart disease, cancer, and stroke. However, despite the decrease in the proportion of deaths due to injury, the death rate from injuries is actually higher among older persons than among younger persons.

Leading Causes of Accidental Death

Motor vehicle accidents accounted for more than 53.1% of accidental Vernon Parish deaths between 2006 and 2010. Poisoning (including accidental drug overdoses) ranked as the second leading cause of accidental death.

Children's Seat Belt/Car Seat Usage

A total of 96.5% of Vernon Parish parents report that their child (age 0 to 17) “always” wears a seat belt (or appropriate car seat for younger children) when riding in a vehicle.

- Better than regional (RFSA) findings.
- Better than what is found nationally.
- Statistically unchanged from 2002 survey findings.

Child “Always” Wears a Seat Belt or Appropriate Restraint When Riding in a Vehicle
(Vernon Parish Parents of Children <18, 2013)

Bicycle Safety

A total of 30.6% of Vernon Parish children age 5 to 17 are reported to “always” wear a helmet when riding a bicycle.

- Better than regional (RFSA) findings.
- Much lower than the national prevalence.

Child “Always” Wears a Helmet When Riding a Bicycle
(Vernon Parish Parents of Children Age 5-17, 2013)
Intentional Injury (Violence)

Age-Adjusted Intentional Injury Deaths

Homicide

Between 2008 and 2010, there was an annual average age-adjusted homicide rate of 4.8 deaths per 100,000 population in Vernon Parish.

- Well below the RFSA rate.
- More favorable than the rate found statewide.
- More favorable than the national rate.
- Satisfies the Health People 2020 target.

**Homicide: Age-Adjusted Mortality**

(2008-2010* Annual Average Deaths per 100,000 Population)

Well below the RFSA rate.
More favorable than the rate found statewide.
More favorable than the national rate.
Satisfies the Health People 2020 target.

Sources: ● CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics.
Data extracted July 2013.
Notes:
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
- NOTE: 2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.

Suicide

Between 2008 and 2010, there was an annual average age-adjusted suicide rate of 9.1 deaths per 100,000 population in Vernon Parish.

- More favorable than regional (RFSA) findings.
- More favorable than the rate found statewide.
- More favorable than the national rate.
- Meets the Health People 2020 target.
Suicide: Age-Adjusted Mortality
(2008-2010* Annual Average Deaths per 100,000 Population)

● NOTE: 2006-2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.

Violent Crime

Self-Reported Violence

A total of 0.9% of Vernon Parish adults acknowledge being the victim of a violent crime in the past five years.

● Better than the regional prevalence.
● Better than the national prevalence.

The prevalence of residents who have been victims of a violent crime in the past 5 years has remained stable.

Victim of a Violent Crime in the Area in the Past 5 Years

Sources: ● PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 45]
● 2013 PRC National Health Survey, Professional Research Consultants.

Notes: ● Asked of all respondents.
● *Prior to 2010, the Vernon Parish survey did not ask if the crime occurred locally (“in your area”).

NOTE:  Due to sparse reporting for several parishes in recent years, reliable offense-based violent crime data are not available for Vernon Parish.
Reports of violence are notably higher among women.

Victim of a Violent Crime in the Past 5 Years
(Vernon Parish, 2013)

Family Violence

A total of 16.3% of Vernon Parish adults acknowledge that they have ever been hit, slapped, pushed, kicked, or otherwise hurt by an intimate partner.

- Comparable to the regional prevalence.
- Comparable to national findings.
- Marks a significant increase from 2010 survey results.

Have Ever Been Hit, Slapped, Pushed, Kicked, or Hurt in Any Way by an Intimate Partner

Reports of domestic violence are notably higher among:

- Women.
- Residents with very low or low income.
Have Ever Been Hit, Slapped, Pushed, Kicked, or Hurt in Any Way by an Intimate Partner

Notes:
● Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
● Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
● *Due to low counts, the Vernon Parish rate represents 2006-2010 data.
● NOTE. 2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.
Survey respondents were further asked about the presence of weapons in the home:

“Are there any firearms now kept in or around your home, including those kept in a garage, outdoor storage area, truck, or car? For the purposes of this inquiry, firearms include pistols, shotguns, rifles, and other types of guns, but do NOT include starter pistols, BB guns, or guns that cannot fire.”

Presence of Firearms in Homes

A total of 62.7% of Vernon Parish adults have a firearm kept in or around their home.

- Similar to what is found regionally.
- Much higher than the national prevalence.
- Among Vernon Parish households with children, 60.9% have a firearm kept in or around the house (well above that reported nationally).

Have a Firearm Kept in or Around the Home

Reports of firearms in or around the home are more prevalent among the following respondent groups:

- Middle and high income households.
- White respondents.

Have a Firearm Kept in or Around the House

(Vernon Parish, 2013)

**Notes**: Asked of all respondents with a firearm in or around the home.
- In this case, firearms include pistols, shotguns, rifles, and other types of guns; this does not include starter pistols, BB guns, or guns that cannot fire.
Diabetes

Diabetes affects nearly 16 million adults and contributes to about 200,000 deaths a year. Diabetes can cause heart disease, stroke, blindness, kidney failure, leg and foot amputations, pregnancy complications, and deaths related to influenza and pneumonia. About 5.4 million adults are unaware they have the disease.

Among adults, diagnosed diabetes (including gestational diabetes) increased 49% from 1990 to 2000. The largest increase was among people age 30–39. Type 2 affects 90%–95% of people with diabetes and is linked to obesity and physical inactivity.

The direct and indirect costs of diabetes in America are nearly $100 billion a year.

- National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

Age-Adjusted Diabetes Mellitus Deaths

Between 2008 and 2010, there was an annual average age-adjusted diabetes mortality rate of 44.3 deaths per 100,000 population in Vernon Parish.

- Higher than the regional rate.
- Higher than the Louisiana rate.
- Higher than the national rate.
- Fails to satisfy the Health People 2020 target.

(2008-2010* Annual Average Deaths per 100,000 Population)

Sources:
- CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted July 2013.

Notes:
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
- The Healthy People 2020 target for Diabetes is adjusted to account for only diabetes mellitus coded deaths.
- NOTE: 2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.
Prevalence of Diabetes

A total of 11.6% of Vernon Parish adults report having been diagnosed with diabetes.

- Similar to what is found regionally.
- Similar to the proportion statewide.
- Similar to the national proportion.

The diabetes prevalence has increased significantly in Vernon Parish since 2002.

A higher prevalence of diabetes is reported among the following demographic groups:

- Adults age 40 and older (note a positive correlation with age).
Diabetes Treatment

Among adults with diabetes, most (82.0%) are currently taking insulin or some type of medication to manage their condition.

- Similar to the regional prevalence.
- Similar to the prevalence found nationally among diabetics.
- Similar over time in Vernon Parish.

Taking Insulin or Other Medication for Diabetes

Among diabetics, 45.2% report not having any problem controlling their blood sugar.

- In 2005, 42.3% of Vernon Parish diabetics reported having no problems controlling their blood sugar (not shown).

Problems Controlling Blood Sugar

(Among Diabetics; Vernon Parish 2013)
Between 2008 and 2010, there was an annual average age-adjusted kidney disease mortality rate of 20.5 deaths per 100,000 population in Vernon Parish.

- Better than the regional rate.
- Better than the rate found statewide.
- Less favorable than the national rate.

Alzheimer’s Disease

Age-Adjusted Alzheimer’s Disease Deaths

Between 2008 and 2010, there was an annual average age-adjusted Alzheimer’s disease mortality rate of 23.6 deaths per 100,000 population in Vernon Parish.

- Lower than the regional rate.
- Lower than the statewide rate.
- Lower than the national rate.

Arthritis & Rheumatism

The current and projected growth in the number of people age 65 years and older in the United States has focused attention on preserving quality of life, as well as length of life. Chief among the factors involving preserving quality of life are the prevention and treatment of musculoskeletal conditions—the major causes of disability in the United States. Among musculoskeletal conditions, arthritis and other rheumatic conditions, osteoporosis, and chronic back conditions have the greatest impact on public health and quality of life.

Nearly one in four Vernon Parish adults (23.5%) report suffering from arthritis or rheumatism.

- Similar to what is found regionally.
- Similar to what is found nationwide.
- The prevalence of arthritis/rheumatism in Vernon Parish has remained statistically unchanged over time.
- Among Vernon Parish adults age 50 and older, 48.4% have arthritis or rheumatism (comparable to the regional figure, higher than the national prevalence).

Prevalence of Arthritis/Rheumatism

MODIFIABLE HEALTH RISK BEHAVIORS
Actual Causes Of Death

A 2002 study (an update to a landmark 1993 study), estimated that as many as 40% of premature deaths in the United States are attributed to behavioral factors. This study found that behavior patterns represent the single-most prominent domain of influence over health prospects in the United States. The daily choices we make with respect to diet, physical activity, and sex; the substance abuse and addictions to which we fall prey; our approach to safety; and our coping strategies in confronting stress are all important determinants of health.

The most prominent contributors to mortality in the United States in 2000 were tobacco (an estimated 435,000 deaths), diet and activity patterns (400,000), alcohol (85,000), microbial agents (75,000), toxic agents (55,000), motor vehicles (43,000), firearms (29,000), sexual behavior (20,000), and illicit use of drugs (17,000). Socioeconomic status and access to medical care are also important contributors, but difficult to quantify independent of the other factors cited. Because the studies reviewed used different approaches to derive estimates, the stated numbers should be viewed as first approximations.

These analyses show that smoking remains the leading cause of mortality. However, poor diet and physical inactivity may soon overtake tobacco as the leading cause of death. These findings, along with escalating healthcare costs and aging population, argue persuasively that the need to establish a more preventive orientation in the US healthcare and public health systems has become more urgent.

### Factors Contributing to Premature Deaths in the United States

While causes of death are typically described as the diseases or injuries immediately precipitating the end of life, a few important studies have shown that the actual causes of premature death (reflecting underlying risk factors) are often preventable.

“Actual Causes of Death in the United States”; (Ali H. Mokdad, PhD; James S. Marks, MD, MPH; Donna F. Stroup, PhD, MSc; Julie L. Gerberding, MD, MPH) JAMA, 291(2004):1238-1245.
Nutrition

Adults

Daily Recommendation of Fruits/Vegetables

A total of 38.8% of area adults report eating five or more servings of fruits and/or vegetables per day.

- Comparable to regional findings.
- Similar to national findings.

 Marks a statistically significant increase in fruit/vegetable consumption in Vernon Parish since 2002.

To measure food and beverage consumption, survey respondents were asked specifically about the foods and drinks they consumed on the day prior to the interview.

There are no statistically significant differences between demographic groups.

Consume Five or More Servings of Fruits/Vegetables Per Day

(Vernon Parish, 2013)

Body Weight

Body Mass Index (BMI), which describes relative weight for height, is significantly correlated with total body fat content. The BMI should be used to assess overweight and obesity and to monitor changes in body weight. In addition, measurements of body weight alone can be used to determine efficacy of weight loss therapy. BMI is calculated as weight (kg)/height squared (m$^2$). To estimate BMI using pounds and inches, use: \[\text{BMI} = \frac{\text{weight (pounds)}}{\text{height (inches)}^2} \times 703.\]

In this report, overweight is defined as a BMI of 25.0 to 29.9 kg/m$^2$ and obesity as a BMI of $\geq$30 kg/m$^2$. The rationale behind these definitions is based on epidemiological data that show increases in mortality with BMIs above 25 kg/m$^2$. The increase in mortality, however, tends to be modest until a BMI of 30 kg/m$^2$ is reached. For persons with a BMI of $\geq$30 kg/m$^2$, mortality rates from all causes, and especially from cardiovascular disease, are generally increased by 50 to 100 percent above that of persons with BMIs in the range of 20 to 25 kg/m$^2$.

Overweight and obesity result from a complex interaction between genes and the environment characterized by long-term energy imbalance due to a sedentary lifestyle, excessive caloric consumption, or both. They develop in a socio-cultural environment characterized by mechanization, sedentary lifestyle, and ready access to abundant food. Attempts to prevent overweight and obesity are difficult to both study and achieve.

Healthy Weight

Based on self-reported heights and weights, only 29.0% of Vernon Parish adults are at a healthy weight (neither underweight nor overweight, BMI = 18.5-24.9).

- Similar to the regional (RFSA) percentage.
- Similar to the Louisiana percentage.
- Less favorable than national findings.
- Fails to satisfy the Healthy People 2020 target.
- Statistically unchanged over time.
Healthy Weight
(Body Mass Index Between 18.5 and 24.9)

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 196]
- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Based on reported heights and weights, asked of all respondents.
- The definition of healthy weight is having a body mass index (BMI), a ratio of weight to height (kilograms divided by meters squared), between 18.5 and 24.9.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.

Overweight Status

Adults

Based on self-reported heights and weights, 69.5% of Vernon Parish adults are overweight or obese (BMI ≥25).

- Similar to the regional prevalence.
- Similar to the Louisiana prevalence.
- Higher than the US prevalence.
- Statistically unchanged over time.

Prevalence of Total Overweight
(Overweight or/Obese Adults; Body Mass Index of 25.0 or Higher)

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 196]
- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Based on reported heights and weights, asked of all respondents.
- The definition of overweight is having a body mass index (BMI), a ratio of weight to height (kilograms divided by meters squared), greater than or equal to 25.0, regardless of gender. The definition for obesity is a BMI greater than or equal to 30.0.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.
Specifically, 36.6% of Vernon Parish adults are obese (BMI ≥ 30, also included in overweight prevalence discussed previously).

- Similar to the regional prevalence.
- Similar to the Louisiana percentage.
- Less favorable than US findings.
- Fails to satisfy the Healthy People 2020 target.

 Marks a statistically significant increase in obesity over time.

Weight Management

Health Advice About Weight Management

A total of 24.6% of adults have been given advice about their weight by a doctor, nurse or other health professional in the past year.

- Comparable to regional findings.
- Comparable to the national findings.
- Marks a significant increase from 2005 survey results.
- Note that 39.4% of obese adults have been given advice about their weight by a health professional in the past year (while 6 in 10 have not).

Have Received Advice About Weight in the Past Year From a Physician, Nurse, or Other Health Professional
(By Weight Classification)

Weight Control

Many diseases are associated with overweight and obesity. Persons who are overweight or obese are at increased risk for high blood pressure, type 2 diabetes, coronary heart disease, stroke, gallbladder disease, osteoarthritis, sleep apnea, respiratory problems, and some types of cancer. The health outcomes related to these diseases, however, often can be improved through weight loss or, at a minimum, no further weight gain.

A total of 42.8% of Vernon Parish adults who are overweight or obese say that they are both modifying their diet and increasing their physical activity to try to lose weight.

- Similar to the regional prevalence among overweight or obese adults.
- Similar to the national percentage among overweight or obese adults.
- Note: 47.3% of Vernon Parish adults who are obese report that they are trying to lose weight through a combination of diet and exercise, compared to 47.4% across the nation.
The proportion of overweight and obese adults in Vernon Parish who are using diet and exercise to try to lose weight has remained unchanged over time.
Relationship of Overweight With Other Health Issues

Overweight and obese adults are more likely to report a number of adverse health conditions.

These include:

- Hypertension (high blood pressure).
- High cholesterol.
- Diabetes.
- Chronic heart disease.

**Relationship of Overweight With Other Health Issues**
(Vernon Parish; By Weight Classification)

Sources: 2013 PRC Community Health Survey, Professional Research Consultants, Inc. (Items 34, 158-160)

Notes: Based on reported heights and weights, asked of all respondents.
Childhood Overweight & Obesity

In children and teens, body mass index (BMI) is used to assess weight status – underweight, healthy weight, overweight, or obese. After BMI is calculated for children and teens, the BMI number is plotted on the CDC BMI-for-age growth charts (for either girls or boys) to obtain a percentile ranking. Percentiles are the most commonly used indicator to assess the size and growth patterns of individual children in the United States. The percentile indicates the relative position of the child’s BMI number among children of the same sex and age.

BMI-for-age weight status categories and the corresponding percentiles are shown below:

- **Underweight**: <5th percentile
- **Healthy Weight**: ≥5th and <85th percentile
- **Overweight**: ≥85th and <95th percentile
- **Obese**: ≥95th percentile

Centers for Disease Control and Prevention.

Based on the heights/weights reported by surveyed parents, **31.1% of Vernon Parish children age 6 to 17 are overweight or obese** (≥85th percentile).

- Similar to the regional prevalence.
- Similar to the prevalence reported nationally.
- In Vernon Parish, overall childhood overweight/obesity is significantly below that first reported in 2005.

**Child Overweight/Obesity**

**Notes:**
- Asked of all respondents with children aged 6-17 at home.
- Overweight among children is estimated based on children’s Body Mass Index status at or above the 85th percentile of US growth charts by gender and age.
Specifically, 13.8% of area children age 6 to 17 are obese (≥95th percentile).

- Similar to the regional prevalence.
- Similar to the national percentage.
- Similar to the Healthy People 2020 target.
- No significant change over time.

- Asked of all respondents with children under 18 at home.
Related Focus Group Findings: Nutrition and Obesity

Many focus group participants discussed nutrition and obesity. The main findings include:

- Poor nutrition
- Cultural traditions
- Fast food establishments
- Nutrition education

Participants believe that residents have poor nutrition which contributes to the high prevalence of obesity in the community. Respondents also worry about the youth in the population because currently the trajectory is to become overweight/obese adults. Attendees feel that Southern cultural traditions influence the level of obesity in the community due to the poor diet and prevalence of fried foods. Many celebrations and events center around food and moderation no longer exists. A participant explains:

“We dance. We party. We eat a lot of really rich food and that’s a lot of the state.” — Vernon Parish Key Informant

Residents have access to fruits and vegetables at local grocery stores and a small Farmer’s Market, but residents continue to make unhealthy choices, which contribute to the high obesity levels. For other citizens, the many fast food establishments represent the convenient, easy option.

Currently the Louisiana Agriculture Center and local churches do some cooking demonstrations, but focus group attendees believe that nutrition education needs to occur more frequently in the community. Many households lack basic knowledge about what a fresh fruit, or vegetable is, appropriate portion sizes, preparing nutritious meals and/or making healthy food choices. A participant describes how the current programming has positively impacted the community and showed people that healthy food can taste good too:

“There are some foods out there that a 30-year-old mother and sometimes even a grandmother have never tried to make; they only have their prepackaged food. I mean the foods they buy are fifty percent sodium and prepackaged, so healthy foods, unless there’s some kind of prep class or there’s an older person in the family that can teach them how to prepare certain vegetables in particular. We have a neighborhood center. Brought some kids in. Didn’t know what an acorn squash was. The guy made an acorn squash soup and they scarfed it up like it was a Big Mac, but they had never had it before.” — Vernon Parish Key Informant
Physical Activity & Fitness

The 1990s brought a historic new perspective to exercise, fitness, and physical activity by shifting the focus from intensive vigorous exercise to a broader range of health-enhancing physical activities. Research has demonstrated that virtually all individuals will benefit from regular physical activity. A Surgeon General’s report on physical activity and health concluded that moderate physical activity can reduce substantially the risk of developing or dying from heart disease, diabetes, colon cancer, and high blood pressure. Physical activity also may protect against lower back pain and some forms of cancer (for example, breast cancer), but the evidence is not yet conclusive.

On average, physically active people outlive those who are inactive. Regular physical activity also helps to maintain the functional independence of older adults and enhances the quality of life for people of all ages. The role of physical activity in preventing coronary heart disease (CHD) is of particular importance, given that CHD is the leading cause of death and disability in the United States. Physically inactive people are almost twice as likely to develop CHD as persons who engage in regular physical activity. The risk posed by physical inactivity is almost as high as several well-known CHD risk factors, such as cigarette smoking, high blood pressure, and high blood cholesterol. Physical inactivity, though, is more prevalent than any one of these other risk factors. People with other risk factors for CHD, such as obesity and high blood pressure, may particularly benefit from physical activity.

Adults’ Physical Activity

Level of Activity at Work

A majority of employed respondents reports low levels of physical activity at work.

- 42.8% of employed respondents report that their job entails mostly sitting or standing, lower than the US figure.
- 34.5% report that their job entails mostly walking.
- 22.8% report that their work is physically demanding (higher than the US figure).

Statistically unchanged from baseline 2005 findings.

Notes:
- Asked of those respondents who are employed for wages.
Leisure-Time Physical Activity

Effects of Physical Inactivity & Unhealthy Diets

- Poor diet and physical inactivity lead to 300,000 deaths each year—second only to tobacco use.
- People who are overweight or obese increase their risk for heart disease, diabetes, high blood pressure, arthritis-related disabilities, and some cancers.
- Not getting an adequate amount of exercise is associated with needing more medication, visiting a physician more often, and being hospitalized more often.

   National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

24.1% of Vernon Parish adults report no leisure-time physical activity in the past month.

- More favorable than the regional prevalence.
- More favorable than the percentage reported across Louisiana.
- Similar to national findings.
- Satisfies the Healthy People 2020 objective.

Lack of leisure-time physical activity is statistically unchanged from 2002 survey findings.

No Leisure-Time Physical Activity in the Past Month

Healthy People 2020 Target = 32.6% or Lower

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 100]
- 2013 PRC National Health Survey, Professional Research Consultants.
- Asked of all respondents.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.
Lack of leisure-time physical activity in the area is higher among:

- Women.
- Adults age 40 and older (note positive correlation with age).

**No Leisure-Time Physical Activity in the Past Month**

---

### Strengthening Activities

In the past month:

**A total of 39.0% of adults regularly participate in strengthening activities** (at least twice weekly) – these are activities designed to strengthen muscles, such as lifting weights or doing calisthenics.

- Better than found throughout the RFSA.
- Marks a significant decrease over time.

### Strengthening Activity

**Source:** PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 101]

**Notes:**
- Asked of all respondents.
- Takes part in activities that are specifically designed to strengthen muscles, such as lifting weights or performing calisthenics, at least twice weekly.
Adults less likely to report participating in strengthening exercises at least twice weekly include:

- Women.
- Adults 40 and older (note negative correlation with age).

**Strengthening Activity**

*(Vernon Parish, 2013)*

A total of 39.1% of Vernon Parish adults typically walk regularly (at least five times per week for more than 10 minutes at a time).

**Average Number of Days Per Week on Which Respondent Walks for More Than 10 Minutes at a Time**

*(Vernon Parish, 2013)*
• Statistically higher than regional findings.

Marks a significant decrease over time.

Walk for More Than 10 Minutes at a Time at Least Five Times Per Week

Health Advice About Physical Activity & Exercise

A total of 34.2% of Vernon Parish adults report that their physician has asked about or given advice to them about physical activity in the past year.

• Similar to what was found throughout the RFSA.
• Less favorable than the national average.

Note: only 42.6% of obese Vernon Parish respondents say that they have talked with their doctor about physical activity/exercise in the past year, lower than found nationally (60.6%).
Children’s Physical Activity

Participation in Physical Activity

Overall, 91.5% of Vernon Parish parents of children 5-17 report that their child is **physically active on a regular basis** (defined as 3+ days per week of vigorous physical activity or 5+ days per week of moderate activity).

- Higher than regional (RFSA) findings.

**Child Is Physically Active on a Regular Basis**
(Among Vernon Parish Parents of Children Aged 5-17, 2013)

![Bar chart showing percentage of children physically active on a regular basis in Vernon Parish and RFSA. Vernon Parish has 91.5% and RFSA has 85.1%.]

**Children's Moderate Physical Activity**

Nearly two-thirds (67.7%) of children engage in regular **moderate** physical activity (5+ times per week for 30+ minutes at a time).

- Comparable to regional (RFSA) findings.

**Child Engages in Regular Moderate Physical Activity**
(Among Vernon Parish Parents of Children Aged 5-17, 2013)

![Bar chart showing percentage of children engaging in regular moderate physical activity in Vernon Parish and RFSA. Vernon Parish has 67.7% and RFSA has 63.3%.]

Notes: Asked of all respondents with children aged 5-17 at home.
In this case, the term “regular basis” refers to 3+ days per week of vigorous physical activity or 5+ days of moderate physical activity.

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc.
Notes: Asked of all respondents with children aged 5-17 at home.
Takes part in activities that produce some increase in breathing or heart rate at least 5 times a week for at least 30 minutes per time.
Children's Vigorous Physical Activity

Nearly 9 in 10 (89.6%) children engage in regular vigorous physical activity (3+ times per week for 20+ minutes at a time).

- Higher than regional (RFSA) findings.

Child Engages in Regular Vigorous Physical Activity
(Among Vernon Parish Parents of Children Aged 5-17, 2013)

Children's Screen Time

Television Watching

In children age 5-17, 39.9% are reported to watch one hour or less of television per day (this includes 7.8% reported to watch “none”); on the other hand, 21.4% are reported to watch 3+ hours of TV daily.

Children: Hours of Television Watching on a Typical School Day
(Vernon Parish Parents of Children Ages 5-17, 2013)

Sources: ● 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 155]
Notes: ● Asked of respondents with children ages 5-17 at home.
  ● “1 Hour” = 60-119 minutes of reported television watching; “2 Hours” = 120-179 minutes; “3 Hours” = 180-239 minutes; etc.
Comparable to regional (RFSA) findings.
Lower than the national prevalence.
Statistically unchanged over time.

Child Watches Three or More Hours of Television on a Typical School Day
(Among Parents of Children Ages 5-17; Vernon Parish, 2013)

Other (Non-TV) Screen Time

Fewer area children age 5-17 (11.3%) are reported to spend three or more hours on other types of screen time for entertainment (video games, Internet, etc.).

Children: Hours of Non-TV Screen Time on a Typical School Day
(Vernon Parish Parents of Children Ages 5-17, 2013)
Similar to regional (RFSA) findings.

Similar to the national prevalence.

**Child Has Three or More Hours of Non-TV Screen Time on a Typical School Day**

(Among Parents of Children Ages 5-17; Vernon Parish, 2013)

On a typical school day, 50.8% of school-age Vernon Parish children spend 3+ hours watching television, playing video games, or using the computer/Internet for entertainment.

- Similar to regional (RFSA) findings.
- Statistically similar to the US findings.

**Children With Three or More Hours per School Day of Total Screen Time [TV, Computer, Video Games, Etc. for Entertainment]**

(Among Parents of Children 5-17)

- Similar to regional (RFSA) findings.
- Statistically similar to the US findings.
Availability of Opportunities for Physical Activity

A total of 46.7% of survey respondents give “excellent” or “very good” ratings of the availability of opportunities for physical activity in their community.

- Another 21.3% gave “good” ratings.

Rating of the Availability of Opportunities to Participate in Physical Activity in the Community

(Vernon Parish, 2013)

In contrast, nearly one-third (32.1%) of Vernon Parish adults gave “fair/poor” ratings of the availability of opportunities for physical activity within the community.

- Similar to regional (RFSA) findings.
- Statistically unchanged since 2010.

“Fair” or “Poor” Evaluations of the Availability of Opportunities to Participate in Physical Activity in the Community

Sources: 2013 PRC Community Health Survey, Professional Research Consultants, Inc. (Item 106)
Notes: Asked of all respondents.
Adults more likely to rate the availability of opportunities to participate in physical activity in the community include:

- Seniors (note positive correlation with age).
- Whites.

“Fair” or “Poor” Evaluations of the Availability of Opportunities to Participate in Physical Activity in the Community

Community Participation in Physical Activity

Many Vernon Parish adults (27.8%) report that they “rarely” or “never” see others in their community being physically active, such as walking, jogging or biking.

- Another 22.3% reported “sometimes” seeing other community members being physically active.

Frequency of Seeing Others in the Community Being Physically Active

(Vernon Parish, 2013)
A total of 49.9% say they “often” see others in their community being physically active, such as walking, jogging or biking.

- Similar to regional (RFSA) findings.

**“Often” See Others in the Community Being Physically Active**

<table>

</thead>
<tbody>
<tr>
<td>49.9%</td>
<td>46.4%</td>
</tr>
</tbody>
</table>

**Sources:**
- 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 105]

**Notes:**
- Asked of all respondents.

**Related Focus Group Findings: Physical Activity**

Many focus group participants discussed the lack of physical activity in the community. The main discussion centered on:

- Low physical activity levels
- Walking paths
- Technology (television or computer)

Focus group attendees feel that **low physical activity levels** increase the obesity rates in the parish. Participants agree that many community members live sedentary lifestyles and this includes children and adolescents.

However, key informants believe that the **walking paths** are well utilized. Respondents think that adding additional playground equipment may bring more families to the walking trail areas and think that there are many opportunities for the residents to be active. Additionally, focus group members view the military personnel as positively influencing their families, and potentially the larger population, with their physical activity requirements.

“There’s lots of activities for their family members, the non-military and military alike, and those kids grow up seeing daddy or mommy get up and put on his PT uniform or her PT uniform and go out and exercise and it’s an education process by osmosis, whereas in our civilian population, the generational thing is you see the 45-year-old mother on a scooter going through Wal-Mart and she’s morbidly obese and there’s her daughter who’s morbidly obese, 20, and there’s the five-year-old child who’s already morbidly obese.” — Vernon Parish Key Informant

Vernon Parish also has a wellness center in the hospital, which is open to the public for a reasonable fee, but attendees think that providing education about the importance of physical activity would benefit community members.
The amount of time that residents spend in front of the television or computer also distresses focus group members. A child’s day no longer includes regular physical activity because of the new technology; children and adolescents watch more television and play more video games than ever before.

“It’s just such a lifestyle, and I know nationally it’s a trend. There’s too much time in front of TV’s, computers, iPhones, everything else and not enough time just being outside. I think we’re probably just worse than other communities, but our young people have the same bad habits... They all have smartphones. They all spend hours on them.” — Vernon Parish Key Informant
Substance Abuse

Substance abuse and its related problems are among society’s most pervasive health and social concerns. Each year, about 100,000 deaths in the United States are related to alcohol consumption. Illicit drug abuse and related acquired immunodeficiency syndrome (AIDS) deaths account for at least another 12,000 deaths. In 1995, the economic cost of alcohol and drug abuse was $276 billion. This represents more than $1,000 for every man, woman, and child in the United States to cover the costs of healthcare, motor vehicle crashes, crime, lost productivity, and other adverse outcomes of alcohol and drug abuse.

A substantial proportion of the population drinks alcohol. Alcohol use and alcohol-related problems also are common among adolescents. Excessive drinking has consequences for virtually every part of the body. The wide range of alcohol-induced disorders is due (among other factors) to differences in the amount, duration, and patterns of alcohol consumption, as well as differences in genetic vulnerability to particular alcohol-related consequences. Alcohol use has been linked with a substantial proportion of injuries and deaths from motor vehicle crashes, falls, fires, and drownings. It also is a factor in homicide, suicide, marital violence, and child abuse and has been associated with high-risk sexual behavior.

Alcohol Use

High-Risk Alcohol Use

Chronic Drinking

A total of 8.6% of area adults averaged two or more drinks of alcohol per day in the past month (chronic drinkers).

- Higher than regional (RFSA) findings.
- Higher than the national figure.
- The chronic drinking prevalence has increased significantly since 2002.

Chronic Drinkers

![Graph showing chronic drinking prevalence over time for Vernon Parish, RFSA, and United States.]

Sources: ● PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 206] ● 2013 PRC National Health Survey, Professional Research Consultants.

Notes: ● Asked of all respondents. ● Chronic drinkers are defined as having 60+ alcoholic drinks in the past month.
Chronic drinking is reported more often among:

- Men.
- Adults under 65.

**Chronic Drinkers**  
(Vernon Parish, 2013)

### Binge Drinking

A total of 18.0% of Vernon Parish adults are binge drinkers.

- Higher than regional (RFSA) findings.
- Similar to the prevalence in Louisiana.
- Similar to the prevalence reported nationwide.
- Satisfies the Healthy People 2020 target.
- Statistically unchanged since 2002.

Binge drinkers include:

1) **MEN** who report drinking 5 or more alcoholic drinks on any single occasion during the past month; and

2) **WOMEN** who report drinking 4 or more alcoholic drinks on any single occasion during the past month.

**Binge Drinkers**

**Notes:**
- Asked of all respondents.

---

*Note: As a self-reported measure – and because this indicator reflects potentially illegal behavior – it is reasonable to expect that it might be underreported, and that the actual incidence of drinking and driving in the community is likely higher.*
In the past month, 2.8% of Vernon Parish adults have ridden with a driver who had perhaps too much to drink.

- Similar to regional (RFSA) findings.
- Lower than the national figure.
- Statistically unchanged since 2005.

Have Ridden With a Driver in the Past Month Who Had Too Much to Drink

A total of 4.7% of Vernon Parish adults acknowledge either drinking and driving or riding with a drunk driver in the past month.

- Similar to regional (RFSA) findings.
- Lower than the national percentage.
- No significant change over time.
Age-Adjusted Cirrhosis/Liver Disease Deaths

Between 2008 and 2010, there was an annual average age-adjusted cirrhosis/liver disease mortality rate of 9.7 deaths per 100,000 population in Vernon Parish.

- Worse than the regional (RFSA) rate.
- Higher than the rate reported across Louisiana.
- Higher than the national rate.
- Fails to satisfy the Health People 2020 target.

Cirrhosis/Liver Disease: Age-Adjusted Mortality
(2008-2010 Annual Average Deaths per 100,000 Population)

Illicit Drug Use

Illegal use of drugs, such as heroin, marijuana, cocaine, and methamphetamine, is associated with other serious consequences, including injury, illness, disability, and death, as well as crime, domestic violence, and lost workplace productivity. Drug users and persons with whom they have sexual contact run high risks of contracting gonorrhea, syphilis, hepatitis, tuberculosis, and human immunodeficiency virus (HIV). The relationship between injection drug use and HIV/AIDS transmission is well known. Injection drug use also is associated with hepatitis B and C infections. Long-term consequences, such as chronic depression, sexual dysfunction, and psychosis, may result from drug use.

Although there has been a long-term drop in overall use, many people in the United States still use illicit drugs. Drug use among adolescents age 12 to 17 years doubled between 1992 and 2005. Drug and alcohol use by youth also is associated with other forms of unhealthy and unproductive behavior, including delinquency and high-risk sexual activity.

A total of 2.9% of Vernon Parish adults acknowledge using an illicit drug in the past month.

- Similar to regional (RFSA) findings.
- Similar to the percentage reported across the nation.
- Satisfies the Healthy People 2020 objective.

Note: As a self-reported measure – and because this indicator reflects potentially illegal behavior – it is reasonable to expect that it might be underreported, and that actual illicit drug use in the community is likely higher.
Illicit Drug Use in the Past Month

Age-Adjusted Drug-Induced Deaths

Between 2008 and 2010, there was an annual average age-adjusted drug-induced mortality rate of 7.0 deaths per 100,000 population in Vernon Parish.

- Lower than the regional (RFSA) rate.
- Lower than the statewide rate.
- Lower than the national rate.
- Satisfies the Healthy People 2020 target.

Drug-Induced Deaths: Age-Adjusted Mortality

(2008-2010* Annual Average Deaths per 100,000 Population)

Sources:
- CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted July 2013.

Notes:
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age adjusted to the 2000 US Standard Population.
- Local, state and national data are simple three-year averages.
- * Due to low numbers of deaths: the rate for Vernon Parish represents 2001-2010 data.
- NOTE: 2006-2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.
Alcohol & Drug Treatment

The stigma attached to substance abuse increases the severity of the problem. The hiding of substance abuse, for example, can prevent persons from seeking and continuing treatment and from having a productive attitude toward treatment. Compounding the problem is the gap between the number of available treatment slots and the number of persons seeking treatment for illicit drug use or problem alcohol use.

A total of 3.0% of Vernon Parish adults say that they have sought professional help for an alcohol or drug problem at some point in their lives.

- Similar to regional (RFSA) findings.
- Similar to the prevalence reported across the nation.
- No significant change over time in Vernon Parish.

Notes: Asked of all respondents.

Related Focus Group Findings: Substance Abuse

Substance abuse in the community is of concern to many focus group attendees. The main issues discussed surrounding substance abuse included:

- Prevalence of drug use
- Prescription medication
- Need additional substance abuse treatment programs and facilities

A number of focus group participants worry about the prevalence of drug use in the parish. Drug use crosses socioeconomic statuses and age ranges. Attendees have concern specifically about alcohol, marijuana, synthetic drugs, methamphetamines, and prescription drugs. Participants feel that many residents have easy access to prescription medication and these drugs quickly lead to addiction.

“It’s like the prescription drugs. Lots of people are just addicted to painkillers. They get them and they sell them or they exchange them with family members. Xanax and oxycodone, all these things are very big in this parish.” — Vernon Parish Key Informant
The selling of drugs is also perceived by some residents as an easy way to make money.

Attendees believe that the community needs additional substance abuse treatment programs and facilities. Only a limited number of organizations provide substance abuse treatment. Respondents would like to see more drug education programs in schools to combat the substance abuse epidemic. No inpatient options operate in the region. Residents must travel for any type of inpatient care. A key informant explains the difficulties acquiring treatment for addicts:

“There’s a man in town that is really bad. I mean he’s a habitual excessive alcoholic. He’s in his late stages. I mean he probably has no liver left and he’s living in squalor and a bunch of young people live with him. We know what they’re doing. They’re mooching off of him. They keep him drunk and then they sell drugs and young people come in and out and I called the coroner and said, ‘We’ve got to do something. Can you commit this man and put him in rehabilitation?’ He said, ‘I’ll take him to the hospital.’ But they wouldn’t admit him because there are no beds for a person like that and there’s no place to send him to.” — Vernon Parish Key Informant

In addition, Vernon Parish’s judicial system can sentence criminals to attend counseling at addictive disorder clinic.

From the substance abuse prevention standpoint, schools have resource officers in the local high schools and attendees feel that these officers have made a positive impact on curtailing substance use in school. Respondents would also like to see more drug education programs in schools to combat the issue.
Cigarette smoking causes heart disease, several kinds of cancer (lung, larynx, esophagus, pharynx, mouth, and bladder), and chronic lung disease. Cigarette smoking also contributes to cancer of the pancreas, kidney, and cervix. Smoking during pregnancy causes spontaneous abortions, low birthweight, and sudden infant death syndrome. Other forms of tobacco are not safe alternatives to smoking cigarettes.

Tobacco use is responsible for more than 430,000 deaths per year among adults in the United States (about 20% of all deaths). If current tobacco use patterns persist in the United States, an estimated 5 million persons under age 18 years will die prematurely from a smoking-related disease. Direct medical costs related to smoking total at least $50 billion per year (other sources estimate more than $75 billion in 1998 (about 8% of the personal healthcare expenditures in the US)); direct medical costs related to smoking during pregnancy are approximately $1.4 billion per year.

Evidence is accumulating that shows maternal tobacco use is associated with mental retardation and birth defects such as oral clefts. Exposure to secondhand smoke also has serious health effects. Researchers have identified more than 4,000 chemicals in tobacco smoke; of these, at least 43 cause cancer in humans and animals. Each year, because of exposure to secondhand smoke, an estimated 3,000 nonsmokers die of lung cancer, and 150,000 to 300,000 infants and children under age 18 months experience lower respiratory tract infections.

Cigarette Smoking

Cigarette Smoking Prevalence

A total of 23.0% of Vernon Parish adults currently smoke cigarettes, either regularly (17.8% every day) or occasionally (5.2% on some days).

![Cigarette Smoking Prevalence](image)

Sources: 2013 PRC Community Health Survey, Professional Research Consultants, Inc. (Item 201)
Notes: Asked of all respondents.

- Similar to regional findings (RFSA).
- Similar to state findings.
- Higher than national findings.
- Fails to satisfy the Healthy People 2020 target.
The current smoking percentage is statistically lower than that reported in Vernon Parish in 2002.

Cigarette smoking is more prevalent among:

- Adults under age 65.
- Very low and low income residents.

Note also:

- 21.7% of women of child-bearing age (ages 18 to 44) currently smoke. This is notable given that tobacco use increases the risk of infertility, as well as the risks for miscarriage, stillbirth and low birthweight for women who smoke during pregnancy.
Environmental Tobacco Smoke

A total of 17.6% of Vernon Parish adults (including smokers and non-smokers) report that a member of their household has smoked cigarettes in the home in the past month an average of four or more times per week.

- Similar to the regional finding.
- Worse than the national finding.
- This indicator has improved over time.

Note that 9.3% of Vernon Parish non-smokers are exposed to cigarette smoke at home, similar to the US prevalence.

**Member of Household Smokes at Home**

![Graph showing the percentage of households where a member smokes in the home over time, with details and sources provided.]

**Notes:**
- Notably higher among adults under age 65 and residents living at very low and low incomes.

Notes: ● Asked of respondents with children ages 12-17 at home.
Similar to regional (RFSA) findings.

Statistically higher than 2010 survey findings.

Child Has Talked With Parents More in the Past Year or So Regarding School Tobacco Control Activities
(Vernon Parish Parents of Children Age 12-17, 2013)

Public Perceptions of Smoking

The majority of Vernon Parish survey respondents believes that most people are against smoking, indicating that the public feels a person “definitely should not smoke” (28.9%) or “probably should not smoke” (35.6%).

Another 10.6% believe that the general public opinion is that it is “okay to smoke sometimes,” and another 25.0% believe that public opinion says it is okay to smoke “as much as a person wants.”
The proportion of respondents who feel that people “definitely should not smoke” is statistically lower than regional (RFSA) findings.

However, there is no significant change over time.

Respondent Perceives That Most People in the Community Believe That Adults Definitely Should Not Smoke
(Vernon Parish, 2013)

Adults more likely to report that adults definitely should not smoke include:

- Women.
- Adults 40 plus, especially seniors (note positive correlation with age).
- Blacks.

Respondent Perceives That Most People in the Community Believe That Adults Definitely Should Not Smoke
(Vernon Parish, 2013)
Other Tobacco Use

Smokeless Tobacco

A total of 9.9% of Vernon Parish adults use chewing tobacco or snuff every day or on some days.

- Similar to what was found throughout the RFSA.
- Significantly higher than the national percentage.
- Fails to satisfy the Healthy People 2020 target.

Smokeless tobacco use in Vernon Parish remains statistically unchanged since 2002.

Notes: ● Asked of all respondents.
- Smokeless tobacco includes chewing tobacco or snuff.

Related Focus Group Findings: Tobacco

Many focus group participants are concerned with tobacco use in the community:

- Cigarette use and smokeless tobacco
- Young adults
- Tobacco prevention education wanted

Focus group participants worry about the negative health consequences of cigarette use and smokeless tobacco. Attendees recognize the addictive nature of tobacco products, but believe that the smoke free ordinance and other policy changes have helped to lower the prevalence of adult smokers. Respondents feel that that a number of young adults still smoke, or chew, and begin use early.

Attendees would like to see more tobacco prevention education in the school setting and it to begin at an early age. An attendee explains the importance of educating youth before they begin to smoke:

“I think the smoking problem has its roots back in the teenagers, because I see a lot of very young people who smoke and I’m very surprised. I think because they don’t have other entertainment, other more healthy entertainment, so they think, ‘Okay, let’s go smoke and drink’ and I think this is where we need to talk, because once somebody is an established smoker, it’s very hard to break this habit. They tell you, ‘Well, I don’t care anymore. I already have heart disease, COPD. What else can happen to me?” — Vernon Parish Key Informant
SELF-REPORTED HEALTH STATUS
Overall Health Status

Self-Reported Health Status

A total of 53.3% of Vernon Parish adults rate their overall health as “excellent” or “very good.”

- Another 30.3% gave “good” ratings of their overall health.

Self-Reported Health Status
(Vernon Parish, 2013)

16.3% of adults believes that their overall health is “fair” or “poor.”

- More favorable than regional (RFSA) findings.
- More favorable than the Louisiana prevalence.
- Similar to the national percentage.

Overall, “fair/poor” responses have remained statistically unchanged in Vernon Parish since the 2002 survey.

Experience “Fair” or “Poor” Physical Health

Sources: ● 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 5]
Notes: ● Asked of all respondents.

Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.
Adults more likely to report experiencing “fair” or “poor” overall health include:

- Adults age 40 and older (note the positive correlation with age).
- Residents living at very low or low incomes.

**Experience “Fair” or “Poor” Physical Health**

Activity Limitations

An estimated 54 million persons in the United States currently live with disabilities. The increase in disability among all age groups indicates a growing need for public health programs serving people with disabilities.

The direct medical and indirect annual costs associated with disability [in the US] are more than $300 billion, or 4 percent of the gross domestic product. This total cost includes $160 billion in medical care expenditures (1994 dollars) and lost productivity costs approaching $155 billion.

The health promotion and disease prevention needs of people with disabilities are not nullified because they are born with an impairing condition or have experienced a disease or injury that has long-term consequences. People with disabilities have increased health concerns and susceptibility to secondary conditions. Having a long-term condition increases the need for health promotion that can be medical, physical, social, emotional, or societal.

A total of 24.1% of Vernon Parish adults are limited in some way in some activities due to a physical, mental or emotional problem.

- Similar to regional (RFSA) findings.
- Similar to the state prevalence.
- Similar to the prevalence nationwide.

The prevalence of activity limitations has increased significantly in Vernon Parish since 2002.
Limited in Activities in Some Way Due to a Physical, Mental or Emotional Problem

Due to a Physical, Mental or Emotional Problem

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 118]
- 2013 PRC National Health Survey, Professional Research Consultants.

Notes:
- Asked of all respondents.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.

In looking at responses by key demographic characteristics, note the following:

- Adults age 40 or older are much more often limited in activities (note positive correlation with age).
- Residents living at very low or low incomes are much more often limited in activities.

A total of 44.8% of adults with activity limitations note that their impairment is due to a work-related illness or injury (higher than the 30.1% reported in 2002).

Limited in Activities in Some Way Due to a Physical, Mental or Emotional Problem

(Vernon Parish, 2013)

44.8% of these adults report that their impairment/health problem was the result of a work-related illness or injury (compared to 30.1% in 2002)

Sources:
- 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Items 118, 120]

Notes:
- Asked of all respondents.
- Income categories reflect respondent’s household income as a ratio to the federal poverty level for their household size: very low income = below poverty; low income = 100% to 200% of poverty; middle/high income = over 200% of poverty.
Among persons reporting activity limitations, these are most often attributed to musculoskeletal issues, such as back/neck problems, arthritis/rheumatism, fractures/joint injuries, or problems walking.

Other problems mentioned with less frequency include lung/breathing problems, heart conditions, and emotional/mental problems.

Mental Health & Mental Disorders

Mental health is a state of successful performance of mental function, resulting in productive activities, fulfilling relationships with other people, and the ability to adapt to change and to cope with adversity. Mental health is indispensable to personal well-being, family and interpersonal relationships, and contribution to community or society. Mental disorders are health conditions that are characterized by alterations in thinking, mood, or behavior (or some combination thereof), which are associated with distress and/or impaired functioning and spawn a host of human problems that may include disability, pain, or death. Mental illness is the term that refers collectively to all diagnosable mental disorders.

Mental disorders generate an immense public health burden of disability. The World Health Organization, in collaboration with the World Bank and Harvard University, has determined that the impact of mental illness on overall health and productivity in the United States and throughout the world often is profoundly underrecognized [Global Burden of Disease study]. In established market economies such as the United States, mental illness is on a par with heart disease and cancer as a cause of disability. Suicide—a major public health problem in the US—occurs most frequently as a consequence of a mental disorder.

Mental disorders occur across the lifespan, affecting persons of all racial and ethnic groups, both genders, and all educational and socioeconomic groups.

As the life expectancy of individuals continues to grow longer, the sheer number—although not necessarily the proportion—of persons experiencing mental disorders of late life will expand. This trend will present society with unprecedented challenges in organizing, financing, and delivering effective preventive and treatment services for mental health.

Mental Health Status

Self-Reported Mental Health Status

A total of 65.6% of Vernon Parish adults rate their overall mental health as “excellent” or “very good.”

- Another 22.2% gave “good” ratings of their own mental health status.

Self-Reported Mental Health Status
(Vernon Parish, 2013)

![Pie chart showing mental health status]

Sources: 2013 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 111]
Notes: Asked of all respondents.
A total of 12.3% of Vernon Parish adults believe that their overall mental health is “fair” or “poor.”

- Similar to what is found in the region (RFSA).
- Comparable to the “fair/poor” percentage reported across the nation.
- Statistically unchanged over time.

Notes: • Asked of all respondents.

Income categories reflect respondent’s household income as a ratio to the federal poverty level for their household size: very low income = below poverty; low income = 100% to 200% of poverty; middle/high income = over 200% of poverty.
Days of Poor Mental Health

In the past month, Vernon Parish residents averaged 3.8 days on which their mental health was not good.

- Similar to regional (RFSA) findings.
- The current average is similar to the 2010 average.

Average Number of Days in the Past Month on Which Respondents’ Mental Health Was Not Good

- Women.
- Respondents with lower incomes.

Average Number of Days in the Past Month on Which Respondents’ Mental Health Was Not Good

(Vernon Parish, 2013)
Days of Feeling Sad, Blue or Depressed

Vernon Parish adults average 3.4 days per month when they felt sad, blue, or depressed.

- Similar to regional (RFSA) findings.
- Similar to most prior survey findings.

Average Number of Days Felt Sad, Blue, or Depressed in Past Month

Averages in Vernon Parish appear to be higher among women and residents at very low or low incomes.

Average Number of Days Felt Sad, Blue, or Depressed in Past Month
(Vernon Parish, 2013)
A total of 14.5% of Vernon Parish adults report having been diagnosed with major depression by a physician at some point in their lives.

- Similar to what was found in the RFSA.

Note that the prevalence of diagnosed major depression is notably higher among:

- Women.
- Community members living at lower income levels.
Symptoms of Chronic Depression

A total of 25.8% of Vernon Parish adults have had two or more years in their lives when they felt depressed or sad on most days, although they may have felt okay sometimes.

- Comparable to regional (RFSA) findings.
- Comparable to national findings.
- Statistically unchanged from 2002 survey findings (although down from 2010 findings).

Have Experienced Symptoms of Chronic Depression

Note that the prevalence of chronic depression is notably higher among:

- Women.
- Community members living at lower income levels.
Mental Health Treatment

Modern treatments for mental disorders are highly effective, with a variety of treatment options available for most disorders, [however], the majority of persons with mental disorders do not receive mental health services.

Evidence that mental disorders are legitimate and highly responsive to appropriate treatment promises to be a potent antidote to stigma. Stigma creates barriers to providing and receiving competent and effective mental health treatment and can lead to inappropriate treatment, unemployment, and homelessness.

The co-occurrence of addictive disorders among persons with mental disorders is gaining increasing attention from mental health professionals. Having both mental and addictive disorders is a particularly significant clinical treatment issue, complicating treatment for each disorder.

Seeking Help

Among adults with chronic depression, 52.2% acknowledge that they have sought professional help for a mental or emotional problem.

- Similar to corresponding regional (RFSA) findings.
- Similar to national findings.
- Note the statistically significant increase in the percentage of Vernon Parish adults with chronic depression who sought professional help in the past year.
- Of those seeking help, 87.7 % report getting the services they needed.

Have Sought Professional Help for a Mental or Emotional Problem
(Among Residents With Chronic Depression, 2013)

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. (Item 115-116)
PRC National Health Survey, Professional Research Consultants.

Notes: Asked of those respondents who have experienced chronic depression.
A total of 15.0% of Vernon Parish adults are currently taking medication or receiving treatment from a doctor or other health professional for some type of mental health condition or emotional problem.

- Identical to regional (RFSA) findings.

Note that mental health treatment is more common among:

- Women.
Health Professional Shortage Areas: Mental Health Care

**Mental Health** designations are approved by the federal Office of Shortage Designation (OSD) in the Health Resources and Services Administration (HRSA). Louisiana’s Bureau of Primary Care and Rural Health (BPCRH) looks at the number of Psychiatrists only to calculate an area’s mental health ratio. A ratio of 30,000:1 is required. The ratio for High Needs is 20,000:1.

For each of the three HPSA Designation types, there are three sub-categories, which include:

- **Geographic designations**—these take into account the entire population of the requested area to all available psychiatrists.

- **Population Group designations**—these are special groups. The most common of these are Low Income and Medicaid-Eligible designations. Low income designations use a ratio built upon the low income population of the area and the physicians providing services to this population. Medicaid-eligible designations are based on the number of Medicaid-eligible people and the physicians that accept Medicaid.

- **Facility designations**—these look at a facility’s outpatient census, waiting times, patients’ residences and in-house faculty to evaluate a facility’s designation eligibility.

Vernon Parish is a geographically designated HPSAs for mental health.
Related Focus Group Findings: Mental Health

Focus group members discussed the fragmented mental health system and the limited services available to residents, with focus on:

- Inadequate number of psychiatrists and treatment facilities
- Outpatient mental health clinics
- Wait times

During the focus group, issues surrounding mental health services arose. Overall, the community suffers due to an **inadequate number of psychiatrists, counselors, and treatment facilities** available to address residents’ behavioral health needs, even those with insurance. **Outpatient mental health clinics** are scattered throughout the communities, but continuity of care suffers due to staff turnover. For those residents who can access behavioral healthcare services, the **wait times** before appointments exceed several weeks. In addition, the mental health clinic in Vernon Parish does not accept just any diagnosis and residents do not have a positive perception of the clinic:

> “The mental health system? What does that look like? We have a mental health clinic next door and they’re open what, three days a week? A counselor certified social worker may come over once a week. They (providers) say that they don’t send more because there’s not enough clients. The clients say that they don’t seek the services because they come so infrequently.” — Vernon Parish Key Informant
Birth Rates

Between 2010 and 2012, Vernon Parish experienced 20.4 births per 1,000 population.

- Higher than found throughout the RFSA.
- Higher than the rate reported statewide.
- Higher than the national birth rate (which reflects 2009-2011 data).

### Birth Rate

- Regional and statewide data for 2012 represent preliminary data.
Prenatal Care

Many risk factors can be mitigated or prevented with good pre-conception and prenatal care. Prenatal visits offer an opportunity to provide information about the adverse effects of substance use, including alcohol and tobacco during pregnancy, and serve as a vehicle for referrals to treatment services. The use of timely, high-quality prenatal care can help to prevent poor birth outcomes and improve maternal health by identifying women who are at particularly high risk and taking steps to mitigate risks, such as the risk of high blood pressure or other maternal complications.

African American and Hispanic women also are less likely than Whites to enter prenatal care early. For both African American and White women, the proportion entering prenatal care in the first trimester rises with maternal age until the late thirties, then begins to decline ... Women in certain racial and ethnic groups also are less likely than White women to breastfeed their infants.

Between 2007 and 2009, 25.9% of Vernon Parish births did not receive early and adequate prenatal care.

- Less favorable than the regional proportion.
- Less favorable than the Louisiana proportion.

Mothers Not Receiving Early and Adequate Prenatal Care
(Percentage of Live Births, 2007-2009)

![Bar chart showing percentage of live births not receiving early and adequate prenatal care in Vernon Parish, RFSA, and LA.

Vernon Parish: 25.9%
RFSA: 12.2%
LA: 14.9%

Sources:
● Agenda for Children and KIDS COUNT Data Center: http://datacenter.kidscount.org.
Note:
● Represents the percentage of all live births within each population who did not receive early and adequate prenatal care.
● The Kotelchuck Index is used to measure early and adequate prenatal care. “Early and Adequate Prenatal Care” means that prenatal care began in month 1, 2, 3, or 4 of pregnancy, and that 80% or more of expected prenatal care visits were received.

Early and continuous prenatal care is the best assurance of infant health.
The percentage of mothers in Vernon Parish who do not receive early and adequate prenatal care is higher than the percentage found during the 2001-2003 reporting period.

The health of mothers, infants, and children is of critical importance, both as a reflection of the current health status of a large segment of the US population and as a predictor of the health of the next generation. Infant mortality is an important measure of a nation’s health and a worldwide indicator of health status and social well-being. As of 1995, the US infant mortality rates ranked 25th among industrialized nations. In the past decade, critical measures of increased risk of infant death, such as new cases of low birth weight (LBW) and very low birth weight (VLBW), have increased in the United States. In addition, the disparity in infant mortality rates between Whites and specific racial and ethnic groups (especially African Americans, American Indians or Alaska Natives, Native Hawaiians, and Puerto Ricans) persists. Although the overall infant mortality rate has reached record low levels, the rate for African Americans remains twice that of Whites.

LBW is associated with long-term disabilities, such as cerebral palsy, autism, mental retardation, vision and hearing impairments, and other developmental disabilities. The general category of LBW infants includes both those born too early (preterm infants) and those who are born at full term but who are too small, a condition known as intrauterine growth retardation (IUGR). Maternal characteristics that are risk factors associated with IUGR include maternal LBW, prior LBW birth history, low prepregnancy weight, cigarette smoking, multiple births, and low pregnancy weight gain. Cigarette smoking is the greatest known risk factor.

Low-Weight Births

A total of 9.1% of 2010-2012 Vernon Parish births were low weight.

- More favorable than found regionally.
- More favorable than the Louisiana proportion.
- Less favorable than the national proportion (which reflects 2009-2011 data).
- Fails to satisfy the Healthy People 2020 target.

Family Planning

In an era when technology should enable couples to have considerable control over their fertility, half of all pregnancies in the United States are unintended. Although between 1987 and 1994 the proportion of pregnancies that were unintended declined in the United States from 57 to 49 percent, other industrialized nations report fewer unintended pregnancies, suggesting that the number of unintended pregnancies can be reduced further. Family planning remains a keystone in attaining a national goal aimed at achieving planned, wanted pregnancies and preventing unintended pregnancies.

Socially, the costs can be measured in unintended births, reduced educational attainment and employment opportunity, greater welfare dependency, and increased potential for child abuse and neglect. Economically, healthcare costs are increased ... The consequences of unintended pregnancy are not confined to those occurring in teenagers or unmarried couples. In fact, unintended pregnancy can carry serious consequences at all ages and life stages.

With an unintended pregnancy, the mother is less likely to seek prenatal care in the first trimester and more likely not to obtain prenatal care at all. She is less likely to breastfeed and more likely to expose the fetus to harmful substances, such as tobacco or alcohol. The child of such a pregnancy is at greater risk of low birth weight, dying in its first year, being abused, and not receiving sufficient resources for healthy development. A disproportionate share of the women bearing children whose conception was unintended are unmarried or at either end of the reproductive age span—factors that, in themselves, carry increased medical and social burdens for children and their parents. Pregnancy begun without some degree of planning often prevents individual women and men from participating in preconception risk identification and management.

Unintended pregnancies occur among females of all socioeconomic levels and all marital status and age groups, but females under age 20 years and poor and African American women are especially likely to become pregnant unintentionally. More than 4 in 10 pregnancies to White and Hispanic females [nationwide] are unintended; 7 in 10 pregnancies to African American females [nationwide] are unintended. Poverty is strongly related to greater difficulty in using reversible contraceptive methods successfully, with these females also the least likely to have the resources necessary to access family planning services and the most likely to be affected negatively by an unintended pregnancy.

Births to Unwed Mothers

Nearly one-fourth (24.8%) of 2010-2012 Vernon Parish births were to women who were not married at the time.

- Lower than regional (RFSA) findings.
- Lower than the percentage reported statewide.
- Lower than that found nationally.

**Births to Unwed Mothers**
(Percentage of Live Births, 2010-2012*)

The percentage of births to unwed mothers in Vernon Parish is dramatically higher in the Black population.

**Births to Unwed Mothers by Race**

- Note that there is a break in data reporting years due to a lack of data; in addition the “2005-2007” Vernon Parish percentage actually includes only 2006 and 2007 data.

### Births to Teenage Mothers

For teenagers, the problems associated with unintended pregnancy are compounded, and the consequences are well documented. Teenage mothers are less likely to get or stay married, less likely to complete high school or college, and more likely to require public assistance and to live in poverty than their peers who are not mothers. Infants born to teenage mothers, especially mothers under age 15 years, are more likely to suffer from low birth weight, neonatal death, and sudden infant death syndrome. The infants may be at greater risk of child abuse, neglect, and behavioral and educational problems at later stages. Nearly 1 million teenage pregnancies occur each year in the United States.

A total of 10.4% of 2010-2012 births were to mothers under the age of 20.

- Lower than regional (RFSA) findings.
- Lower than the percentage reported across Louisiana.
- Higher than the percentage found nationally.
Births to Mothers Under Age 20
(Percentage of Live Births, 2010-2012*)

The percentage of births to mothers under age 20 in Vernon Parish has decreased over time, despite increases in the mid-to-late 2000s.

Sources: ● Louisiana Department of Health and Hospitals Office of Public Health.
● Centers for Disease Control and Prevention, Division of Public Health Surveillance and Informatics. Epidemiology Program Office.
Notes: ● Rates are annual average new cases per 100,000 population.
● US rates represent 2009-2011 data. United States measles cases only include those infected while in the United States.

Pertussis

Between 2010 and 2012, there were no reported pertussis cases in Vernon Parish.

● Lower than regional (RFSA) incidence.
● Lower than the Louisiana incidence rate.
● Much lower than the national incidence rate (2009-2011 data).

Incidence rates have remained the same over the past several years in Vernon Parish.

Pertussis Incidence
(Annual Average Cases per 100,000 Population)

- "Incidence rate" is the number of new cases of a disease occurring during a given period of time.
- It is usually expressed as cases per 1,000 or 100,000 population per year.
Acute Hepatitis C

There were no incidences of acute hepatitis C between 2010 and 2012 in Vernon Parish.

- Lower than the regional rate.
- Lower than the statewide rate.
- Lower than the US rate (which reflects 2009-2011 data).
- The Vernon Parish rate satisfies the Healthy People 2020 target.

**Hepatitis C (Acute) Incidence**

(2010-2012* Annual Average Cases per 100,000 Population)

Healthy People 2020 Target = 0.25 or Lower

Hepatitis C incidence has been null since 2003 in Vernon Parish.
Influenza & Pneumonia Vaccination

Flu Shots

Among adults age 65 and older, nearly 7 in 10 (69.2%) received a flu shot within the past year.

- Similar to RFSA findings.
- Similar to RFSA Louisiana findings.
- Similar to RFSA national findings.
- Fails to satisfy the Healthy People 2020 target.
- No statistical change over time.

**Have Had a Flu Shot in the Past Year**
(Among Vernon Parish Seniors 65+, 2013)

![Flu Shot Vaccination Chart]

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 177]
- 2013 PRC National Health Survey, Professional Research Consultants.

Notes:
- Asked of all respondents aged 65 and older.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.

Pneumonia Vaccination

Among adults age 65 and older, 75.8% have received a pneumonia vaccination at some point in their lives.

- Similar to regional (RFSA) findings.
- Similar to Louisiana findings.
- Statistically comparable to national findings.
- Fails to satisfy the Healthy People 2020 objective.
- No statistical change over time.
Have Ever Had a Pneumonia Vaccine
(Among Vernon Parish Seniors 65+, 2013)

Healthy People 2020 Target = 90% or Higher

Sources:

- 2011 PRC National Health Survey, Professional Research Consultants.

Notes:
- Asked of all respondents aged 65 and older.
- Because the CDC implemented changes to the BRFSS weighting methodology in 2011, state findings might not be directly comparable to the regional or national findings outlined in this report.
Tuberculosis

Tuberculosis (TB) is an infectious disease caused by a type of bacteria called Mycobacterium tuberculosis. TB is spread from person to person through the air, as someone with active tuberculosis of the respiratory tract coughs, sneezes, yells, or otherwise expels bacteria-laden droplets.

The Institute of Medicine (IOM), an arm of the National Academy of Sciences, released a report in May 2000 that lays out an action plan for eliminating tuberculosis in the United States … As a key part of the plan, new TB treatment and prevention strategies must be developed that are tailored to the current environment. Among today’s hallmarks:

- Tuberculosis now occurs in ever-smaller numbers in most regions of the country.
- Foreign-born people (both legal and undocumented immigrants) coming to the United States from countries with high rates of TB now account for nearly half of all TB cases.
- Higher numbers of cases are concentrated in pockets located in major metropolitan areas, and this increased prevalence is due, in large part, to the increased number of people with or at risk for HIV/AIDS infection.
- Other groups, such as HIV-infected people and the growing population of prison inmates, the homeless, and intravenous drug abusers, are emerging as being at high risk.

Between 2010 and 2012, the annual average tuberculosis incidence rate (new cases per year) was 0.6 cases per 100,000 population in Vernon Parish.

- Lower than the regional incidence rate.
- Lower than the Louisiana incidence rate.
- Lower than the national incidence rate (which reflects 2009-2011 data).
- Satisfies the Healthy People 2020 target.

Tuberculosis Incidence
(2010-2012* Annual Average Cases per 100,000 Population)

- Rates are annual average new cases per 100,000 population.
HIV

In the United States, HIV/AIDS remains a significant cause of illness, disability, and death, despite declines in 2002 and 2005.

Principal health determinants. Behaviors (sexual practices, substance abuse, and accessing prenatal care) and biomedical status (having other STDs) are major determinants of HIV transmission. Unprotected sexual contact, whether homosexual or heterosexual, with a person infected with HIV and sharing drug-injection equipment with an HIV-infected individual account for most HIV transmission in the United States. Increasing the number of people who know their HIV serostatus is an important component of a national program to slow or halt the transmission of HIV in the United States.

For persons infected with HIV, behavioral determinants also play an important role in health maintenance. Although drugs are available specifically to prevent and treat a number of opportunistic infections, HIV-infected individuals also need to make lifestyle-related behavioral changes to avoid many of these infections. The new HIV antiretroviral drug therapies for HIV infection bring with them difficulties in adhering to complex, expensive, and demanding medication schedules, posing a significant challenge for many persons infected with HIV.

Because HIV infection weakens the immune system, people with tuberculosis (TB) infection and HIV infection are at very high risk of developing active TB disease.

Comparing the 1980s to the 1990s, the proportion of AIDS cases in White men who have sex with men declined, whereas the proportion in females and males in other racial and ethnic populations increased, particularly among African adults and Hispanics. AIDS cases also appeared to be increasing among injection drug users and their sexual partners. The true extent of the epidemic remains difficult to assess for several reasons, including the following:

- Because of the long period of time from initial HIV infection to AIDS and because highly active antiretroviral therapy (HAART) has slowed the progression to AIDS, new cases of AIDS no longer provide accurate information about the current HIV epidemic in the United States.
- Because of a lack of awareness of HIV serostatus as well as delays in accessing counseling, testing, and care services by individuals who may be infected or are at risk of infection, some populations do not perceive themselves to be at risk. As a result, some HIV-infected persons are not identified and provided care until late in the course of their infection.

Age-Adjusted HIV/AIDS Deaths

Between 2001 and 2010, there was an annual average age-adjusted HIV/AIDS mortality rate of 5.3 deaths per 100,000 population in the Rapides Foundation Service Area (parish-level data are not available).

- Lower than found statewide.
- Higher than found nationally.
- Fails to satisfy the Health People 2020 target.

**HIV/AIDS: Age-Adjusted Mortality**
(2001-2010 Annual Average Deaths per 100,000 Population)

![Graph showing age-adjusted HIV/AIDS mortality by race and for RFSA, Louisiana, and United States.]

**Notes:**
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
- Parish-level data not available due to low numbers of deaths.
- NOTE: 2006-2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.

HIV/AIDS mortality is dramatically higher among Blacks in the RFSA when compared with Whites (more than seven times higher, in fact). This disparity is also seen — and to an even greater degree — both statewide and nationally.

**HIV/AIDS: Age-Adjusted Mortality by Race**
(2001-2010 Annual Average Deaths per 100,000 Population)

![Graph showing age-adjusted HIV/AIDS mortality by race and for White, Black, and Total populations.]

**Notes:**
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
- NOTE: 2006-2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.
HIV/AIDS mortality has decreased over time in the RFSA, echoing the state and national trends.

Notes: ● Deaths from 1999 forward are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10); pre-1999 data were coded using ICD-9 coding.
● Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
● State and national data are simple three-year averages; the RFSA three-year average is weighted by population.
● NOTE: 2006-2008 deaths for the RFSA are underreported due to problems registering Allen Parish deaths with the Louisiana Vital Statistics Office.

### HIV/AIDS Cases

#### HIV/AIDS Incidence

Between 2009 and 2012, there was an annual average of 10.5 new HIV/AIDS cases per 100,000 population in Vernon Parish.

- Lower than the regional incidence rate.
- Lower than the Louisiana incidence rate.

HIV/AIDS Characteristics

The following chart provides an illustration of the demographic characteristics of new HIV/AIDS cases (2009-2012) in the RFSA. Note:

- Incidence was more prevalent in males.
- Black residents made up the majority of new cases.
- The greatest proportion of new cases occurred in the 25-44 age groups.

Characteristics of New HIV Cases
(Rapides Foundation Service Area, 2009-2012)

Gender

- Male: 70.4%
- Female: 29.6%

Race/Ethnicity

- Black: 57.8%
- White: 22.9%
- Hispanic: 17.3%
- Other: 2.0%

Age

- 25-34: 26.6%
- 35-44: 24.2%
- 45-54: 22.2%
- 55-64: 9.1%
- 65+: 0.7%
- 6-12: 0.7%
- 13-19: 1.4%
- 20-24: 14.1%
- 25-24: 14.1%
As of the end of 2012, there were 57 Vernon Parish residents living with HIV/AIDS. This represents 0.3% of the state’s 18,422 persons living with HIV/AIDS.

**Persons Living With HIV/AIDS**
(As of December 31, 2012)

Throughout Louisiana, there were 18,422 persons living with HIV/AIDS as of 12/31/2012. This represents 0.3% of the total statewide.

**HIV Testing**

Among Vernon Parish adults age 18-44, 37.9% report that they have been tested for human immunodeficiency virus (HIV) in the past year.

- Higher than the regional proportion.
- Higher than the proportion found nationwide.
- Satisfies the Healthy People 2020 target.

Denotes a significant decrease from 2002 survey findings.

**Tested for HIV in the Past Year**
(Among Respondents 18-44)

Sources: ● 2013 PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 183]
● 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes: ● Reflects respondents age 18 to 44.
● Note that the Healthy People 2020 objective is for ages 15-44.
By demographic characteristics, testing higher among:

- Men.
- Black adults.

Notes:
- Reflects respondents age 18 to 44.
- Income categories reflect respondent’s household income as a ratio to the federal poverty level for their household size: very low income” = below poverty; “low income” = 100% to 200% of poverty; “middle/high income” = over 200% of poverty.
Sexually Transmitted Diseases

Sexually transmitted diseases (STDs) refer to the more than 25 infectious organisms transmitted primarily through sexual activity. STDs are among many related factors that affect the broad continuum of reproductive health agreed on in 1994 by 180 governments at the International Conference on Population and Development (ICPD). At ICPD, all governments were challenged to strengthen their STD programs. STD prevention as an essential primary care strategy is integral to improving reproductive health.

Despite the burdens, costs, complications, and preventable nature of STDs, they remain a significant public health problem, largely unrecognized by the public, policymakers, and public health and healthcare professionals in the United States. STDs cause many harmful, often irreversible, and costly clinical complications, such as reproductive health problems, fetal and perinatal health problems, and cancer. In addition, studies of the worldwide human immunodeficiency virus (HIV) pandemic link other STDs to a causal chain of events in the sexual transmission of HIV infection.

Gonorrhea

Between 2010 and 2012, the annual average gonorrhea incidence rate was **104.5 cases per 100,000 population in Vernon Parish**.

- Lower than the regional incidence rate.
- Lower than the Louisiana rate.
- Similar to the national incidence rate (which reflects 2009-2011 data).

HOUSING
Housing Conditions

**Type of Dwelling**

The majority of Vernon Parish residents (64.5%) own their own home, while 18.8% rent a house or apartment.

- Another 7.3% live with family members.

![Type of Dwelling Chart](image)

**Condition of Local Housing**

Nearly one-half (49.3%) of survey respondents consider the condition of homes in their neighborhoods to be “excellent” or “very good.”

- Another 34.8% gave good ratings.

![Rating of Condition of Neighborhood Homes Chart](image)
However, 15.8% of Vernon Parish residents consider the condition of homes in their neighborhoods to be only “fair” or “poor.”

- Similar to regional (RFSA) findings.
- This indicator remains statistically unchanged since 2005.

Perceive Condition of Neighborhood Homes to Be “Fair” or “Poor”

Viewed by demographic segments, those residents more likely to give low ratings of the condition of neighborhood homes include the following:

- Young adults (age 18 to 39).
- Residents living at lower incomes.
Availability of Affordable Housing

When asked to rate the availability of affordable local housing, just over one-fifth (20.5%) of survey respondents gave "excellent" or "very good" opinions.

- Another 25.0% gave "good" ratings.

However, 54.6% of Vernon Parish residents consider the availability of affordable housing in their areas to be "fair" or "poor."

- Higher than regional (RFSA) findings.

Unfavorably, this marks a significant increase in "fair/poor" ratings since this was first measured in 2005.

Perceive the Availability of Affordable Local Housing to Be "Fair" or "Poor"
Segmented by demographic characteristic, residents more likely to give low ratings of the availability of affordable homes in the community include:

- Residents under age 65.
- Low income and very low income residents.

Notes:  
● Asked of all respondents.

Income categories reflect respondent’s household income as a ratio to the federal poverty level for their household size: “very low income” = below poverty; “low income” = 100% to 200% of poverty; “middle/high income” = over 200% of poverty.

**Housing Displacement**

A total of 8.7% of survey respondents report that they have had to go live with a friend or relative at some point in the past two years, even if only temporarily, because of an emergency.

- Similar to regional (RFSA) findings.
- Statistically unchanged over time.

PERCEPTIONS OF TEEN ISSUES
Teen Issues

Issues Perceived by Residents as “Major Problems” for Teens

Of five tested issues, teenage drug use and tobacco use are viewed by surveyed adults as the biggest concerns facing teens in Vernon Parish (37% or more of survey respondents rate these as “major problems” for teens in their own community).

Note that evaluations of tobacco use, alcohol use and drinking and driving have decreased significantly since 2002 (meaning that fewer residents now consider each to be a “major problem”). The other issues have remained statistically unchanged.

OTHER ISSUES
Collaboration

Related Focus Group Findings

Participants spent time discussing the varying levels of collaboration occurring in the community between non-profit organizations, schools, healthcare providers and hospitals. The issues surrounding collaboration were:

- Varying opinions on the level of collaboration
- Rapides Foundation

Attendees had varying opinions on the level of collaboration occurring in the community. Some participants spoke about the excellent coordination occurring between non-profit organizations, the larger healthcare system, and the Rapides Foundation. Participants agree that many coalitions operate in Vernon Parish to improve the health of the residents, and the Rapides Foundation helps to foster the collaborative process.

Other participants agree that organizations collaborate to some degree, but that this remains an area in need of improvement. A key informant explains:

"But that’s where the systems we have in place could do a better job, I think. I think it isn’t always all about the resources. It’s how we implement and execute the programs and resources that we have." — Vernon Parish Key Informant
Quality of Life

Related Focus Group Findings

Many focus group participants discussed the quality of life in the parish and the factors that contribute to it included:

- Mixed reviews about the quality of life
- Lack cultural and entertainment opportunities, or outdoor recreation
- Economic development

Focus group attendees have mixed reviews about the quality of life in Vernon Parish. The military presence is seen as a very positive thing for the community as it brings a healthier, more diverse population to the area. In general, the attendees enjoy living in the parish, but do not feel that the quality of life is high. Key informants describe the parish as not having many entertainment, or outdoor recreation opportunities. Nothing is available to attract, or retain the younger population, so they turn to illegal activities.

Key informants did describe efforts to improve economic development, through a parish-wide Economic Development Council, but the number of unemployed residents remains high. This frustrates respondents because employers struggle to open businesses in the parish because the non-educated workforce do not have the appropriate skills, and, or, cannot pass a drug test. Vernon Parish organizations need employees, but struggle to locate local applicants. Several participants describe that apathy toward employment exists within the communities:

"The culture is that you’re cooler if you don’t work and just use drugs and smoke. As I said, it’s terrible how much we have problems staffing. It cost us a lot of money because we train people and then sometimes they have to move, so we lost all the money we spent on their training...There are jobs that even in my medical clinic, we need nurse aide. We need receptionist. We cannot find good people to work at the medical office. We simply cannot. We train them on the job. They don’t need any background training except just maybe show up for work." — Vernon Parish Key Informant

"Vernon Home Health wanted to hire a physical therapist. It took forever. I think they got somebody from Alexandria. I mean why not from here? Where are the people here? I keep asking, ‘Where are the people who want to work?’“ — Vernon Parish Key Informant
DEMOGRAPHIC PROFILE
The 2010 census population for Vernon Parish was 52,334, comprising 14.8% of the nine-parish Rapides Foundation Service Area:

Population Distribution of the RFSA
(2010 Population)

The median income in Vernon Parish in 2011 (in inflation-adjusted dollars) was $45,292.

- However, note that this is below the US median income of $52,762.

Median Income in the Past 12 Months
(2007-2011; In 2011 Inflation-Adjusted Dollars)

Note the following breakout of 2007-2011 estimates of poverty status.

14.0% of Vernon Parish residents lives below the federal poverty level.

- This is similar to what was found nationally.

Percent/Number of Total Population Living Below Poverty Level
In all, nearly one in four Vernon Parish households (24.3%) have annual incomes below $25,000.

- Similar to what was found nationally.
