Report on Community Health

Catahoula Parish, Louisiana

Summary of Findings from the **2002 Community Health Assessment**

Sponsored by

Our Purpose

Dear Community Member:

This assessment was conducted to identify issues of primary concern and to provide critical information to all those in a position to make an impact on the health of our community — healthcare providers, government, social service agencies, businesses and religious groups, to name just a few. The results will enable all of us to more strategically establish priorities, develop interventions, and commit resources to improve the health of our community.

We believe the Community Health Assessment can — and will — serve as a tool toward reaching three basic goals:

- To improve resident's health status, increase their life spans and elevate their overall quality of life.
- To reduce health disparities among residents.
- To increase accessibility to preventive health services for all community members.

While there are many positive indicators of health status in our community, there is much work to do. Health is — and must be — an issue of concern and action for all of us. We hope the information revealed through the Community Health Assessment will encourage collaboration to address the multi-faceted health needs of our community.

The Research

The area defined for the purposes of this research includes Catahoula Parish, Louisiana, as part of an overall larger study area including II parishes in Central Louisiana. The research process included:

Community Health Survey — This assessment involved a telephone survey measuring health status and behavioral risk factors among 400 adults (18 and older) in Catahoula Parish.

Secondary Data — Existing data, especially public health data and statewide and nationwide risk assessments, complement the survey process and, in some cases, provide a benchmark against which the results of the survey may be compared.

Community Health Panels — The third research phase consisted of a Community Health Panel where community representatives were gathered in a focus group setting. The goal of this panel was to gain greater perspective on the health of area residents.

Health Care Resources

Medically Underserved Areas (MUAs) may be a whole parish or a group of contiguous barishes, a group of parishes or civil divisions or a group of urban census tracts in which residents have a shortage of personal health services.

Healthcare **Professional** Shortage **Areas** (HPSAs) may have shortages of primary medical care, dental or mental health providers and may be urban or rural areas, population groups or medical or other public facilities.

In the Rapides Foundation Service Area, each of the II parishes has been designated a Medically Underserved Area, signifying a shortage of personal health services for residents of these parishes.

Further, note the following designations as Health Professional Shortage Areas:

- Allen, Avoyelles, Concordia, Grant, LaSalle, Vernon and Winn Parishes are designated as HPSAs for primary care services for all residents.
- Catahoula Parish is designated as a primary care HPSA for low-income residents; Natchitoches Parish is designated as a primary care HPSA for two census tracts in the northwest portion of the parish; Rapides Parish is designated as a primary care HPSA for persons eligible for Medicaid.
- Catahoula, Natchitoches, Vernon and Winn Parishes are designated as HPSAs for dental care services for all residents.
- Allen Parish is also designated as an HPSA for mental health care services for all residents.

Health Care Resource Shortage Designations

	Medically Underserved Area (MUA)	Health Professional Shortage Area: Primary Care	Health Professional Shortage Area: Dental Care	Health Professional Shortage Area: Mental Health Care
Allen	х	x		х
Avoyelles	x	x		
Catahoula	x	For Low-Income Populations	x	
Concordia	x	x		
Evangeline	x			
Grant	x	x		
LaSalle	x	x		
Natchitoches	x	Northwest Area Only	x	
Rapides	x	For Medicaid-Eligible Population		
Vernon	x	x	x	
Winn	x	x	x	

Division of Shortage Designation, Bureau of Primary Health Care and Bureau of Health Professions, Health Resources and Services Administration, US Department of Health and Human Services.

"Designated" status for civilian population as of November 2002.

Healthy People 2010 Goals

Healthy People 2010: Understanding and Improving Health is part of the Healthy People 2010 initiative that is sponsored by the U. S. Department of Health and Human Services. Healthy People 2010 outlines a comprehensive, nationwide health promotion and disease prevention agenda. It is designed to serve as a roadmap for improving the health of all people in the United States during the first decade of the 21st century.

Like the preceding Healthy People 2000 initiative—which was driven by an ambitious, yet achievable, 10-year strategy for improving the Nation's health by the end of the 20th century—Healthy People 2010 is committed to a single, overarching purpose: promoting health and preventing illness, disability, and premature death.

To access the full set of objectives, visit the Healthy People Understanding and 2010 website at www.healthypeople.gov.

Improving Health

Reading the Charts

The following pages describe some of the top findings of this assessment relative to regional, statewide and national findings, as well as to Healthy People 2010 targets where available.

In the charts on the following pages, statistical tests are performed and identified through the use of icons:

Indicates that the local findings are more favorable than the benchmark group, and that the difference is statistically significant. For example, a "sunny" icon in the US column means that local findings are better than national findings.

Indicates that the local findings are less favorable than the benchmark group, and that the difference is statistically significant. For example, a "rainy" icon in the HP2010 column means that local findings do not satisfy Year 2010 targets.

Actual Causes of Death

While we may measure deaths due to heart disease, stroke, cancers, or infant deaths, we should always keep in mind that factors such as tobacco use, diet, physical activity and alcohol use substantially contribute to these deaths.

For example, as shown in the adjacent chart, tobacco use accounts for 19% of all U.S. deaths.

Other lifestyle and personal behavior (nongenetic) risk factors include microbes, toxins, firearms, sexual behavior, motor vehicles, and drug use.
