TUBERCULOSIS 155
This 2005 PRC Community Health Assessment is a systematic, data-driven approach to identifying the health status, behaviors and needs of community members in Grant Parish, Central Louisiana, as a follow-up to a similar survey conducted by PRC in 2002. Throughout the report, comparisons will also be made to the entire nine-parish Rapides Foundation Service Area (RFSA)*.

The following map describes this geographical definition.
METHODOLOGY

2005 PRC Community Health Survey

A precise and carefully executed methodology is critical in asserting the validity of the results gathered in the PRC Community Health Survey. Thus, to ensure the best representation of the population surveyed, a telephone interview methodology was employed. The primary advantages of telephone interviewing are timeliness, efficiency and random selection capabilities.

Sample Design

The sample design used for this effort consisted of a random sample of 400 individuals aged 18 and older in Grant Parish in Central Louisiana. Once these data were collected, the sample was weighted in proportion to the population distribution at the ZIP Code level. Population estimates were based on census projections of adults aged 18 and over provided in the latest Business Information Systems Demographic Portfolio from Environmental Systems Research Institute, Inc. (ESRI).

All administration of the surveys, data collection and data analysis was conducted by Professional Research Consultants, Inc. (PRC).

Sampling Error

For statistical purposes, the maximum rate of error associated with a sample size of 400 respondents is ±4.9% at the 95 percent level of confidence.

In addition, for further analysis, keep in mind that each percentage point recorded among the total sample of survey respondents is representative of approximately 153 Grant Parish adults aged 18 and older (based on current population estimates). Thus, in a case where 3.4% of the
total sample gives a particular response to a survey question, this is representative of approximately 520 adults and therefore must not be dismissed as too small to be significant.

**Sample Characteristics**

To accurately represent the population studied, PRC strives to minimize bias through application of a proven telephone methodology and random-selection techniques. And, while this random sampling of the population produces a highly representative sample, it is a common and preferred practice to “weight” the raw data to improve this representativeness even further. This is accomplished by adjusting the results of a random sample to match the demographic characteristics of the population surveyed (poststratification), so as to eliminate any naturally occurring bias. Specifically, once the raw data are gathered, respondents are examined by key demographic characteristics (namely gender, age, race, ethnicity, and poverty status) and a statistical application package applies weighting variables that produce a sample which more closely matches the population for these characteristics. Thus, while the integrity of each individual’s responses is maintained, one respondent’s responses may contribute to the whole the same weight as, for example, 1.1 respondents. Another respondent, whose demographic characteristics may have been slightly oversampled, may contribute the same weight as 0.9 respondents.

The following chart outlines the characteristics of the sample for key demographic variables, compared to actual population characteristics revealed in census data. [Note that the sample consisted solely of area residents aged 18 and older; data on children were given by proxy by the person most responsible for that child’s healthcare needs, and these children are not represented demographically in this chart.]

![Population And Sample Characteristics](chart)

Further note that the income descriptions and segmentation used in this report are based on 2005 administrative poverty thresholds determined by the U.S. Department of Health & Human Services. These guidelines define poverty status by household income level and number of persons in the household (e.g., the 2005 guidelines place the poverty threshold for a family of four at $19,350 annual household income or lower). In sample segmentation: “Very Low Income” includes community members living in a household with defined poverty status (below poverty); “Low Income” includes those living between 100% and 200% of poverty (i.e., just

---

**Source:**

- 2005 PRC Community Health Survey, Professional Research Consultants.
- *White and Black or African American sample percentages do not include Hispanic respondents who did not offer a race response.*
above the poverty level, earning up to twice the poverty threshold); and “Middle/High Income” refers to households with incomes more than twice the poverty threshold (>200% of poverty) defined for their household size.

The sample design and the quality control procedures used in the data collection ensure that the sample is representative. Thus, the findings may be generalized to the total population of Grant Parish adults with a high degree of confidence.

### Public Health, Vital Statistics & Other Data

Various existing (secondary) data sources were consulted to complement the research quality of this Community Health Assessment. Data were obtained from the following sources (specific citations are included in the graphs throughout this report):

- Centers for Disease Control & Prevention (CDC)
- ESRI BIS Demographic Portfolio (Estimates Based on Census 2000)
- Louisiana Commission on Law Enforcement
- Louisiana Department of Health & Hospitals
- National Center for Health Statistics

### Benchmark Data

#### Statewide Risk Factor Data

Statewide risk factor data are provided where available as an additional benchmark against which to compare local findings. These data are published online by the Centers for Disease Control and Prevention and the U.S. Department of Health & Human Services.

#### National Risk Factor Data

National risk factor data provided in comparison charts are taken from the 2005 PRC National Health Survey. The methodological approach for the national study is identical to that employed in this assessment, and these data may be generalized to the U.S. population with a high degree of confidence.
Healthy People 2010

Healthy People 2010: Understanding and Improving Health is part of the Healthy People 2010 initiative that is sponsored by the U. S. Department of Health & Human Services. Healthy People 2010 outlines a comprehensive, nationwide health promotion and disease prevention agenda. It is designed to serve as a roadmap for improving the health of all people in the United States during the first decade of the 21st century.

“With [specific] health objectives in 28 focus areas, Healthy People 2010 will be a tremendously valuable asset to health planners, medical practitioners, educators, elected officials, and all of us who work to improve health. Healthy People 2010 reflects the very best in public health planning—it is comprehensive, it was created by a broad coalition of experts from many sectors, it has been designed to measure progress over time, and, most important, it clearly lays out a series of objectives to bring better health to all people in this country.”

— Donna E. Shalala, (Former) Secretary of Health & Human Services

Like the preceding Healthy People 2000 initiative—which was driven by an ambitious, yet achievable, 10-year strategy for improving the nation’s health by the end of the 20th century—Healthy People 2010 is committed to a single, overarching purpose: promoting health and preventing illness, disability and premature death.

Trends In Survey Data

Throughout this report, for survey-derived indicators, comparisons with prior year data (2002, or in some cases, 1997) will also be provided where available. The statistical significance of the difference between trend year data is noted in the text of this report.

NOTE: Tests for statistical significance take into account (and error rates vary according to) variables such as the number of persons responding to a specific question and where a particular response rate falls between 0% and 100%. In other words, trend comparisons may be found to be statistically significant for one indicator but not for another, even though the net difference found for each is the same.
Healthy People 2010 & the Nation’s Leading Health Indicators*

A major challenge throughout the history of Healthy People has been to balance a comprehensive set of health objectives with a smaller set of health priorities. Thus, Healthy People 2010 has identified the following health issues as the Leading Health Indicators for the Nation:

<table>
<thead>
<tr>
<th>Healthy People 2010: Nation’s Leading Health Indicators</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical Activity</td>
</tr>
<tr>
<td>Overweight &amp; Obesity</td>
</tr>
<tr>
<td>Tobacco Use</td>
</tr>
<tr>
<td>Substance Abuse</td>
</tr>
<tr>
<td>Responsible Sexual Behavior</td>
</tr>
<tr>
<td>Mental Health</td>
</tr>
<tr>
<td>Injury &amp; Violence</td>
</tr>
<tr>
<td>Environmental Quality</td>
</tr>
<tr>
<td>Immunization</td>
</tr>
<tr>
<td>Access to Healthcare</td>
</tr>
</tbody>
</table>

The Leading Health Indicators reflect the major public health concerns in the United States and were chosen based on their ability to motivate action, the availability of data to measure their progress, as well as their relevance as broad public health issues. The Leading Health Indicators illuminate individual behaviors, physical and social environmental factors, and important health system issues that greatly affect the health of individuals and communities. Underlying each of these indicators is the significant influence of income and education.

The process of selecting the Leading Health Indicators mirrored the collaborative and extensive efforts undertaken to develop Healthy People 2010. The process was led by an interagency work group within the U.S. Department of Health and Human Services. Individuals and organizations provided comments at national and regional meetings or via mail and the Internet. A report by the Institute of Medicine, National Academy of Sciences, provided several scientific models on which to support a set of indicators. Focus groups were used to ensure that the indicators are meaningful and motivating to the public.

For each of the Leading Health Indicators, specific objectives derived from Healthy People 2010 will be used to track progress. This small set of measures will provide a snapshot of the health of the Nation. Tracking and communicating progress on the Leading Health Indicators through national- and State-level report cards will spotlight achievements and challenges in the next decade. The Leading Health Indicators serve as a link to the 467 objectives in Healthy People 2010 and can become the basic building blocks for community health initiatives.

The Leading Health Indicators are intended to help everyone more easily understand the importance of health promotion and disease prevention and to encourage wide participation in improving health in the next decade. Developing strategies and action plans to address one or more of these indicators can have a profound effect on increasing the quality of life and the years of healthy life and on eliminating health disparities—creating healthy people in healthy communities.

**Americans’ Perceptions Of The Leading Health Indicator Areas**

In the *2005 PRC National Health Survey*, respondents were presented with problems associated with these 10 “Leading Health Indicators” and were asked to evaluate each as a “major problem,” “moderate problem,” “minor problem,” or “not a problem” in their own community. As shown in the following chart:

- **Obesity/overweight** is perceived to be a “major” or “moderate” problem by more than three-fourths of Americans.
- Roughly two-thirds also view alcohol/drug abuse, poor access to healthcare, and tobacco use as “major/moderate” problems in their communities.

**Perceived Severity Of Healthy People 2010's Nation's Leading Health Indicator Areas**

(United States, 2005)

SUMMARY OF ASSESSMENT FINDINGS

COMPARISON WITH BENCHMARK DATA

The following charts summarize Grant Parish findings for key indicators, and visually depict comparison with benchmark data, where available, for The Rapides Foundation Service Area (RFSA), Louisiana, and the United States. Trend comparisons, where available, are also depicted.

Note the following key used for benchmark comparisons: ******* (denotes a favorable comparison or trend), ******* (denotes an unfavorable comparison or trend), and ******* (denotes statistically similar findings, or no clear trend). A “blank” cell means that no data is available to make a comparison or view a trend for this indicator.

SIGNIFICANT TRENDS

The following section highlights both positive and negative trends observed in health indicators for Grant Parish.

- **Survey Data Indicators**: Trends for survey-derived indicators represent significant changes measured between the 2002 and 2005 PRC Community Health Surveys.

- **Other Data Indicators**: Trends for other indicators (e.g., public health indicators) represent point-to-point changes between the most current reporting period and the earliest presented in this report (typically representing the span of a decade).

### Positive Trends For Grant Parish

Health status and risk indicators have *improved* for the following:

**Access To Healthcare Services**
- Barriers To Healthcare Access
  (Specifically: Office Hours And Appointment Availability)

**Cancer**
- Cancer Deaths

**Cancer Screenings**
- Sigmoidoscopy/Colonoscopy Testing (50+)

**Cardiovascular Disease**
- Heart Disease Deaths
- Stroke Deaths
- Cardiovascular Risk Factors
- Taking Action To Control High Cholesterol

**Family Planning**
- Teen Births

**Hepatitis A**
- Hepatitis A Incidence

**HIV/AIDS**
- HIV/AIDS Deaths

**Injury & Violence**
- Unintentional Injury Deaths
- Motor Vehicle Deaths
- Violent Crime Rate
- Homicide Deaths
**Kidney Disease**
- Kidney Disease Deaths

**Maternal, Infant And Child Health**
- Adequate Prenatal Care

**Nutrition And Overweight**
- Prevalence Of Overweight Children And Adults

**Respiratory Disease**
- Pneumonia/Influenza Deaths

**Primary Care**
- Routine Checkups For Children

**Sexually Transmitted Diseases**
- Primary And Secondary Syphilis Incidence
- Hepatitis B Incidence

**Substance Abuse**
- Cirrhosis/Liver Disease Deaths

**Tuberculosis**
- Tuberculosis Incidence

**Negative Trends For Grant Parish**

Health status and risk indicators have *gotten worse* for the following:

**Access To Healthcare Services**
- Barriers To Healthcare Access
  (Specifically: Transportation)

**Cardiovascular Disease**
- Prevalence Of High Blood Cholesterol

**Diabetes**
- Diabetes Mellitus Deaths

**Enteric Diseases**
- Salmonellosis Incidence
- Shigellosis Incidence

**Hepatitis C**
- Hepatitis C Incidence
Housing
  - Housing Displacement

Injury & Violence
  - Suicide Deaths

Maternal, Infant And Child Health
  - Neonatal Death Rate
  - Infant Death Rate

Mental Health
  - Alzheimer’s Disease Deaths

Physical Activity & Fitness
  - Strengthening Activity

Respiratory Disease
  - Chronic Lower Respiratory Disease Deaths

Sexually Transmitted Diseases
  - Chlamydia Incidence
  - Gonorrhea Incidence

Substance Abuse
  - Current Drinking
  - Chronic Drinking
  - Current Smoking
  - Smoking Cessation

Significant Changes In Perceptions

Grant Parish respondents noted a statistically significant change in perception between 2002 and 2005 with regard to:

Perceptions Of Teen Issues
  - Perceptions Of Teen Drug Use As A "Major Problem"
  - Perceptions Of Teen Pregnancy As A "Major Problem"
Access to quality care is important to eliminate health disparities and increase the quality and years of healthy life for all persons in the United States... Limitations in access to care extend beyond basic causes, such as a shortage of healthcare providers or a lack of facilities. Individuals also may lack a usual source of care or may face other barriers to receiving services, such as financial barriers (having no health insurance or being underinsured), structural barriers (no facilities or healthcare professionals nearby), and personal barriers (sexual orientation, cultural differences, language differences, not knowing what to do, or environmental challenges for people with disabilities).

HEALTH INSURANCE COVERAGE

Healthcare Coverage

A total of 71.9% of Grant Parish adults aged 18 to 64 report having some type of health insurance coverage.

- A total of 53.7% of Grant Parish adults aged 18 to 64 report having healthcare coverage through private insurance.
- Another 18.2% report coverage through a government-sponsored plan, including Medicaid, Medicare, military benefits, and/or “other” (unspecified) government programs.

Source: 2005 PRC Community Health Survey, Professional Research Consultants. [Item 164]
Note: Reflects respondents age 18 to 64.
Among Medicare recipients, 62.5% have supplemental healthcare coverage.

- Lower than the 78.3% reported nationally.

### Have Additional Supplemental Coverage
(Among Recipients Of Medicare; Grant Parish, 2005)

- **62.5%**
- **37.5%** vs. 78.3% Nationwide

**Source:** • 2005 PRC Community Health Survey, Professional Research Consultants. [Item 79]

**Note:** • Reflects those respondents who currently receive Medicare.

### Healthcare Benefits

Among adults with healthcare coverage, nearly all report coverage for both physician visits and hospital visits; however more than one out 20 has no coverage for prescriptions.

### Aspects Of Healthcare Coverage
(Among Those With Health Insurance Coverage; By Region, 2005)

**Source:** • 2005 PRC Community Health Survey, Professional Research Consultants. [Items 80-81]

**Note:** • Reflects those respondents who have health insurance coverage.
Lack Of Health Insurance Coverage

Uninsured Population

More than one in four Grant Parish adults between the ages of 18 and 64 (28.1%) have no insurance coverage for healthcare expenses.

- Similar to the 23.8% reported throughout The Rapides Foundation Service Area (RFSA).
- Worse than the 20.0% reported nationwide.
- The Healthy People 2010 target is universal coverage (0% uninsured).

**TREND:** The prevalence of uninsured adults in Grant Parish is statistically similar to 2002 findings.

Further, note the following:

- 64.1% of persons living at very low incomes and 45.5% of persons living at low incomes (including the “working poor”) report being uninsured (compared to 8.7% of persons living at middle/high incomes).

- Note that the sample of Black/African American respondents was relatively small; therefore, differences which seem notable may not be statistically different. [Note also that, because the parish sample was random and conducted in proportion to the actual population, other races were not sampled in numbers large enough to allow for segmentation.]
Impact Of Poor Access
Persons without health insurance coverage are less likely to have a regular medical care provider, receive routine care, or receive preventive healthcare screenings.

Preventive Healthcare
(By Insured Status, 18+; Grant Parish, 2005)

Source: • 2005 PRC Community Health Survey, Professional Research Consultants. [Items 27,29,30,49,52,85,156,160]
Note: • Reflects all respondents.
• Insured respondents include those with either private or government-sponsored insurance plans.
In all, 42.4% of Grant Parish adults report some type of difficulty or delay in obtaining healthcare services in the past year.

- Statistically similar to the 37.4% reported across the RFSA.
- Worse than the 35.4% reported nationwide.
- Fails to satisfy the Healthy People 2010 target (7% or lower).

**TREND:** Statistically similar to the 45.9% reported in 2002.

The following chart further examines access difficulties by respondent demographics.

- Adults under 65 are more likely to report delays or difficulties in accessing care.
- Persons living at lower incomes report greater difficulty accessing healthcare.
- Black/African American respondents report difficulties more often than do White respondents.
- Further, persons without health insurance coverage much more often report difficulties or delays in accessing healthcare than do insured respondents.
Barriers To Healthcare Access

Specifically, survey participants were asked whether any of six types of barriers to access prevented them from seeing a physician or obtaining a prescription in the past year.

Of the six tested barriers, cost of prescription medicines impacted the greatest share of adults in the parish (23.2% say they were unable to obtain a needed prescription in the past year because of the cost).

- **Cost of the doctor visit** and **difficulty getting a doctor appointment** were the second and third most common barriers to healthcare services (affecting 19.4% and 15.7% of respondents, respectively).

In the following chart, note that:

- In Grant Parish, transportation issues relating to accessing healthcare are *significantly greater* than in the RFSA.
- Grant Parish compares unfavorably to the U.S. when looking at some of the barriers (namely prescription costs, cost of physician visits, and transportation availability).
**TREND:** In comparison to 2002 findings, two statistically significant decreases were reported, signifying positive changes for Grant Parish. These include barriers related to: appointment availability and office hours. In addition, a statistically significant increase was reported related to transportation, signifying a negative change for Grant Parish.

**Barriers To Access Have Prevented Medical Care In The Past Year**

(By Region, 2005)

**Barriers To Access Have Prevented Medical Care In The Past Year**

(Grant Parish, 2002-2005)
**Uninsured Adults**

Grant Parish residents without health insurance coverage are more likely to experience specific barriers to healthcare access, particularly as related to cost.

**Barriers To Healthcare Access**

Note: Reflects all respondents. Insured respondents include those with either private or government-sponsored insurance plans.

**Children**

Surveyed parents were also asked if, within the past year, they experienced any trouble in receiving medical care for a randomly selected child in their household.

**A total of 2.0% of surveyed parents say there was a time in the past year when they needed medical care for their child, but were unable to get it.**

- More favorable than the 4.7% prevalence found throughout the RFSA and the 6.1% reported nationwide.

Specific types of difficulties encountered included references to **poor quality of care, long waits and office hours.**

**Have Had Trouble Obtaining Medical Care For Child In The Past Year**

(By Region, 2005)

Among Grant Parish parents reporting difficulty obtaining medical care for their child in the past year (3 respondents), 50.8% cited poor quality of care as the primary reason. Other reasons included long waits and office hours.

Source: 2005 PRC Community Health Survey, Professional Research Consultants. [Item 122-123]

Note: Asked of respondents with children under the age of 18.
PRIMARY CARE SERVICES

A majority (82.2%) of Grant Parish adults say they have a particular place where they usually go for healthcare; this is predominantly a doctor’s office.

- Nearly identical to the 83.2% reported across the RFSA.
- Note, however, that 11.0% of people with a source of medical care say that this is a hospital emergency room.

Source Of Medical Care
(Grant Parish, 2005)

| Yes | 82.2% |
| No  | 17.8% |

Dr’s Office 56.2% vs. 83.2% RFSA
Hospital ER 11.0%
Clinic/Health Ctr 28.4%
Other 1.9%
Military/VA 2.5%

Source: • 2005 PRC Community Health Survey, Professional Research Consultants. [Item 25-26]
Note: • Asked of all respondents.

Specific Source Of Ongoing Care

Having a “specific source of ongoing care” includes having a doctor’s office, clinic, urgent care center, walk-in clinic, health center facility, hospital outpatient clinic, HMO or prepaid group, military/VA clinic, or some other kind of place to go if one is sick or needs advice about his or her health. A hospital emergency room is not considered a source of ongoing care in this instance.

Only 73.0% of Grant Parish adults were determined to have a specific source of ongoing medical care.

- Similar to the 72.2% found across the RFSA.
- Less favorable than the 79.9% reported nationally.
- Fails to satisfy the Healthy People 2010 target (96% or higher).
Although no key demographic segment satisfies the Healthy People 2010 objective, the following adults are less likely to report a source for ongoing medical care:

- Men.
- Adults aged 18 to 39.
- Persons living at low or very low incomes.
- Uninsured adults.
Utilization Of Primary Care Services

*Adults*

*In the past year, 68.5% of Grant Parish adults visited a physician for a routine checkup.*

- Similar to the 70.8% reported across the RFSA and the 65.6% reported nationwide.
- **TREND:** Statistically unchanged from the 71.4% reported in Grant Parish in 2002.

### Have Visited A Physician For A Routine Checkup Within The Past Year

(By Region; 2002-2005 Trend Data)

</tr>
</tbody>
</table>

Source: • PRC Community Health Surveys, Professional Research Consultants. [Item 27]
• 2005 PRC National Health Survey, Professional Research Consultants.

Note: • Asked of all respondents.
• State data not available.

Note the following demographic findings:

- As might be expected, there is a strong correlation with age: 90.7% of Grant Parish adults aged 65 and older have had a checkup in the past year, compared to 52.2% of those aged 18 to 39.
- Black/African American respondents more often report a routine physician visit than do White respondents.
  - Although this finding may seem contradictory with findings that show that Blacks/African Americans experience poorer access to health services, it is consistent with other PRC research. One possible explanation is that Blacks/African Americans tend to experience higher prevalence of chronic conditions (such as high blood pressure, diabetes, etc.) that require more frequent monitoring.
Children

A total of 88.7% of surveyed parents report that their child had a routine checkup in the past year.

- Similar to the 85.5% reported across the RFSA.
- More favorable than the 76.6% reported nationwide.

**TREND:** Statistically higher than the 78.0% reported in Grant Parish in 2002.
Availability Of Primary Care & Other Health Services

Health Professional Shortage Areas

Health professional shortage areas (HPSAs) are designated by the federal Shortage Designation Branch (SDB) in the Health Resources and Services Administration (HRSA) based on the shortage/underserved criteria established by regulation (e.g., the ratio of population to available health providers).

Types Of HPSA Designations & Sub-Categories

- Primary Care Designations
- Dental Designations
- Mental Health Designations

For each of the three HPSA Designation types, there are three sub-categories, which include:

- **Geographic designations** - these take into account the entire population of the requested area to all available primary care physicians.

- **Population Group designations** - these are special groups. The most common of these are Low Income and Medicaid Eligible designations. Low income designations use a ratio built upon the low income population of the area and the physicians providing services to this population. Medicaid eligible designations are based on the number of Medicaid eligible people in the area and the physicians that accept Medicaid.

- **Facility designations** look at a facility’s outpatient census, waiting times, patients' residences and in-house faculty to evaluate a facility's designation eligibility.

Maps of the most current designations of parishes in The Rapides Foundation Service Area are presented on the following pages.

---

1 Louisiana Department of Health and Hospitals, Office of the Secretary. Primary Care & Rural Health Website. http://www.dhh.state.la.us/offices/page.asp?id=88&detail=3814.
Primary Care

Primary care designations pertain to an area's access to physicians that principally practice in one of the following: family practice, general practice, internal medicine, pediatrics and OB/GYN. A ratio is used to measure the level of primary care access. To be considered underserved, most areas in the state are considered to be high needs areas; therefore, a ratio of \( \geq 3,000 \) possible patients to one primary care physician full-time equivalent (FTE) is usually required. Provider FTEs are determined by taking the number of hours per week the physician spends in primary care services, either in-office or on-rounds at a hospital, divided by 40. The total of these FTEs is divided by the total resident/civilian population of the area.\(^2\)

---

\(^2\) Louisiana Department of Health and Hospitals, Office of the Secretary. Primary Care & Rural Health Website. [http://www.dhh.state.la.us/offices/page.asp?id=88&detail=3814](http://www.dhh.state.la.us/offices/page.asp?id=88&detail=3814).
Dental Care

Dental designations are also approved by the Shortage Designation Branch. These are designated on a similar ratio scheme. Dental FTEs are calculated by starting with the number of hours of patient care provided by a dentist per week. The FTE is then weighted according to the dentist's age and the number of assistants the dentist employs. A ratio of ≥4,000 possible patients to one dentist FTE is usually required (in high needs areas).³

Mental Health Care

Mental health designations are also approved by the Shortage Designation Branch. There are several ways to figure an area’s mental health ratio that include looking at the number of psychiatrists and/or that number plus the other core mental health providers in the area.4

Medically Underserved Areas

Medically Underserved Areas (MUAs) identify areas or populations with a shortage of healthcare services. Documentation of shortage for MUAs includes several indicators in addition to the availability of healthcare providers. These factors include infant mortality rate, poverty rate, and percentage of population aged 65 or over.

Grant Parish, as well as all parishes throughout the RFSA, is designated as an MUA.

A total of 44.4% of Grant Parish adults rely on family physicians as their primary source of healthcare information.

- Books/magazines, the Internet, personal experience, friends/relatives and hospital publications are also important sources of healthcare information.

**TREND:** When comparing primary sources for healthcare information among residents of Grant Parish, adults this year are more likely to be unable to state their primary source of healthcare information when compared with 2002 findings.

EMERGENCY ROOM SERVICES

A total of 8.6% of Grant Parish adults have gone to a hospital emergency room more than once in the past year about their own health.

- Better than the 12.7% reported throughout the RFSA.
- Similar to U.S. findings (5.9%).

**TREND:** Statistically unchanged from the 12.3% reported locally in 2002.

### Have Used A Hospital Emergency Room More Than Once In The Past Year
(By Region; 2002-2005 Trend Data)

Among Grant Parish respondents who used a hospital emergency room in the past year, 58.1% reportedly used the ER because of an emergency or life-threatening situation. Another 21.1% indicated that the visit was during after-hours or on the weekend.

Note the dramatic variation (by income, race and insured status) when examining ER utilization by demographic characteristics.

### Have Used A Hospital Emergency Room More Than Once In The Past Year
(Grant Parish, 2005)

Source: • 2005 PRC Community Health Survey, Professional Research Consultants. [Item 30]

Note: • Asked of all respondents.
• Income categories reflect respondent's household income as a ratio to the federal poverty level for their household size:
  - "very low income" = below poverty
  - "low income" = 100% to 200% of poverty
  - "middle/high income" = over 200% of poverty.
ORAL HEALTH

Nearly one-half (46.6%) of Grant Parish adults visited a dentist or dental clinic (for any reason) in the past year.

- Less favorable than the RFSA prevalence (55.6%).
- Less favorable than the 65.4% found nationwide.
- Does not satisfy the Healthy People 2010 target (56% or higher).

**TREND:** Statistically similar to 2002 findings.

Leading Causes Of Death

Together, the top five causes of death account for nearly two-thirds of all 2002 deaths in Grant Parish.

- **Cancers** (malignant neoplasms) are the leading cause of death, accounting for 24.4% of all deaths.
- **Heart disease** is the second leading cause of death, accounting for 19.9% of all deaths.
- **Chronic lower respiratory disease** is the third leading cause of death, accounting for 7.0% of deaths.
- Cerebrovascular disease (stroke) and **diabetes** are the fourth and fifth leading causes of death, each accounting for 5.0% of all deaths.
- Other leading causes include Alzheimer’s disease, unintentional injuries, pneumonia/influenza, and kidney disease.

Note that regionally, statewide and nationally, heart disease is the leading cause of death; whereas, in Grant Parish cancer is the leading cause of death.

### Leading Causes Of Death (By Region, 2002)

Source: • CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted July 2005.

Note: • Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
• CLRD is chronic lower respiratory disease.
In order to compare data among regions, it is necessary to look at rates of death — these are figures which represent the number of deaths in relation to the population size, such as deaths per 100,000 population, as is used here.

Furthermore, in order to compare localities without undue bias toward younger or older populations, the common convention is to adjust the data to a common baseline age distribution (e.g., the 2000 U.S. population, as is used here). Use of these “age-adjusted” rates provides the most valuable means of gauging mortality against normative or benchmark data, as well as Healthy People 2010 targets.

Between 2000-2002, Grant Parish experienced an overall annual average age-adjusted death rate of 1,073.4 per 100,000 population for deaths due to all causes.

- Just above RFSA and state rates.
- Higher than the overall U.S. rate (856.3).
- Higher among Grant Parish Blacks/African Americans than among Whites.

**Age-Adjusted Mortality: All Causes**

(By Region And Race; 2000-2002 Deaths Per 100,000 Population)

Note:
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
- Parish, state and national data are simple three-year averages, the RFSA three-year averages are weighted by population.
**TREND:** Age-adjusted mortality (all causes) has declined in the parish over the past decade. Likewise, Louisiana and U.S. death rates decreased steadily during this timeframe.

### Age-Adjusted Mortality: All Causes
(By Region; 1993-2002)

Note:
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
- Data for 1999 and subsequent years are not fully comparable to data from 1998 and prior years, due to changes in coding of causes of deaths resulting from the switch from the ninth revision of the International Classification of Diseases (ICD9) to the tenth revision (ICD10).
- Parish, state and national data are simple three-year averages, the RFSA three-year averages are weighted by population.

### Age-Adjusted Death Rates For Selected Causes

The following chart outlines 2000-2002 annual average age-adjusted death rates per 100,000 population for selected causes of death.

- **Versus Healthy People 2010:** Grant Parish age-adjusted death rates fail to satisfy the outlined Healthy People 2010 targets for the following conditions: heart disease, cancer, stroke, diabetes, motor vehicle accidents, cirrhosis/liver disease, suicide and homicide.
- **Versus United States:** Further, Grant Parish death rates exceed those reported across the nation for each cause listed, with the exception of cirrhosis/liver disease.
- **Versus RFSA:** Parish rates also exceed those reported throughout the RFSA, with the exception of heart disease, cancer, motor vehicle accidents, and cirrhosis/liver disease.

Source:  

Note:  
- Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population and coded using ICD-10 codes.  
- *The Healthy People 2010 Heart Disease target is adjusted to account for all diseases of the heart; the Healthy People 2010 target for Diabetes is adjusted to account for only diabetes mellitus coded deaths.  
- Parish, state and national data are simple three-year averages, the RFSA three-year averages are weighted by population.

(For infant mortality data, see “Maternal, Infant & Child Health.”)
Heart disease and stroke—the principal components of cardiovascular disease—are the first and third leading causes of death in the United States, accounting for more than 40% of all deaths.

- About 950,000 Americans die of heart disease or stroke each year, which amounts to one death every 33 seconds.
- Although heart disease and stroke are often thought to affect men and older people primarily, it is also a major killer of women and people in the prime of life. More than half of those who die of heart disease or stroke each year are women.
- Each year, about 63 of every 100,000 deaths are due to stroke.

Looking at only deaths due to heart disease or stroke, however, understates the health effects of these two conditions:

- About 61 million Americans (almost one-fourth of the population) live with the effects of stroke or heart disease.
- Heart disease is a leading cause of disability among working adults.
- Stroke alone accounts for the disability of more than 1 million Americans.
- Almost 6 million hospitalizations each year are due to heart disease or stroke.
- About 4.5 million stroke survivors are alive today.

The economic effects of heart disease and stroke on the U.S. healthcare system grow larger as the population ages. In 2001, for example, the [nationwide] cost for all cardiovascular diseases was $300 billion: for heart disease the cost was $105 billion; for stroke, $28 billion. Lost productivity due to stroke and heart disease cost more than $129 billion.

— National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

### Age-Adjusted Heart Disease & Stroke Deaths

**Heart Disease**

The greatest share of cardiovascular deaths are attributed to heart disease.

**Between 2000 and 2002, there was an annual average age-adjusted heart disease death rate of 284.0 deaths per 100,000 population in Grant Parish.**

- More favorable than the rates reported throughout RFSA (310.4).
- Comparable to the rate reported throughout Louisiana (279.7).
- Less favorable than nationwide rates (248.7).
- Fails to satisfy the Healthy People 2010 objective (213.7 or lower).
- Ranging from 266.5 among Whites to 399.5 among Black/African Americans.
**TREND**: Grant Parish age-adjusted heart disease death rates declined steadily between 1993 and 2002, as did regional, state and national rates.

Stroke Deaths

Between 2000 and 2002, there was an annual average age-adjusted stroke death rate of 73.3 deaths per 100,000 population in Grant Parish.

- Much higher than regional (69.3), state (63.8), and national (58.3) rates.
- Fails to satisfy the Healthy People 2010 objective (48.0 or lower).
- Higher (112.8) among Blacks/African Americans than among Whites (67.7).

Note: Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).

Data for 1999 and subsequent years are not fully comparable to data from 1998 and prior years, due to changes in coding of causes of deaths resulting from the switch from the ninth revision of the International Classification of Diseases (ICD9) to the tenth revision (ICD10).
Prevalence Of Heart Disease & Stroke

Prevalence Of Heart Disease

A total of 12.1% of Grant Parish adults report that they suffer from or have been diagnosed with heart disease, such as coronary heart disease, angina or heart attack.

- Statistically similar to the 8.9% reported throughout the RFSA.
- Less favorable than the 8.2% reported nationwide.

**TREND:** This year's prevalence of heart disease is statistically similar to the 11.1% reported in 2002.

---

Prevalence Of Stroke

A total of 4.5% of Grant Parish adults report that they have suffered from or been diagnosed with cerebrovascular disease (stroke).

- Comparable to the 3.6% reported across the RFSA, as well as the percentage noted nationwide.

**TREND:** This year's prevalence of stroke is statistically similar to the 3.7% reported in 2002.

---

Source: • PRC Community Health Surveys, Professional Research Consultants. [Item 36]
• 2005 PRC National Health Survey, Professional Research Consultants.
Note: • Asked of all respondents.
• Respondents were asked if they have ever been diagnosed with chronic heart disease, including coronary heart disease, angina, or a heart attack.
• State data not available.
Cardiovascular Risk Factors

Hypertension (High Blood Pressure)

High blood pressure is known as the “silent killer” and remains a major risk factor for coronary heart disease, stroke, and heart failure. About 50 million adults in the United States have high blood pressure.

High Blood Pressure Testing

95.4% of Grant Parish adults have had their blood pressure tested within the past two years.

- Similar percentages were recorded across the RFSA, as well as throughout the U.S. overall.
- Statistically similar to the Healthy People 2010 target (95% or higher).

**TREND:** Statistically unchanged from the 96.4% reported three years ago.
Prevalence Of Hypertension

33.1% of adults nationwide have been told at some point by a health professional that their blood pressure was high.

- Lower than the 38.2% reported across the RFSA.
- Higher than the statewide prevalence of hypertension (29.0%).
- Statistically similar to the 34.2% reported nationally.
- More than twice the Healthy People 2010 target (16% or lower).

Note also that 83.7% of persons reporting hypertension report that they have been told their blood pressure was high on more than one occasion.

**TREND:** The 2005 proportion is statistically similar to the 36.7% reported in 2002.
Demographic analysis reveals that only young adults satisfy the Healthy People 2010 target; prevalence is particularly high among older adults.
**Hypertension Management**

More than 9 in 10 adults (93.1%) with high blood pressure (multiple high readings) are currently taking action to control their hypertension (such as taking medication, changing diet, exercising).

- Similar to the 91.0% reported across the RFSA.
- Nationwide, a similar percentage of hypertensive adults is taking action to control their levels.
- Close to satisfying the Healthy People 2010 target (95% or higher).

**TREND:** Current hypertension management is similar to that reported in 2002.

---

**Taking Action To Control High Blood Pressure**

Note:
- Asked of respondents who have been told that their blood pressure was high.
- In this case, the term "action" includes medication, change in diet, and/or exercising.
- State data not available.
High Blood Cholesterol

High blood cholesterol is a major risk factor for coronary heart disease that can be modified. More than 50 million U.S. adults have blood cholesterol levels that require medical advice and treatment. More than 90 million adults have cholesterol levels that are higher than desirable. Experts recommend that all adults aged 20 years and older have their cholesterol levels checked at least once every 5 years to help them take action to prevent or lower their risk of coronary heart disease. Lifestyle changes that prevent or lower high blood cholesterol include eating a diet low in saturated fat and cholesterol, increasing physical activity, and reducing excess weight.

Blood Cholesterol Testing

79.4% of surveyed adults have had their blood cholesterol checked within the past five years.

- Much higher than the statewide prevalence.
- Lower than the 86.8% reported nationwide.
- Close to the Healthy People 2010 target (80% or higher).

**TREND:** This year’s proportion is nearly identical to the 79.7% reported in 2002.

### Have Had Blood Cholesterol Level Checked Within The Past Five Years

- Behavioral Risk Factor Surveillance System Survey Data. Atlanta, Georgia. United States Department of Health and Human Services, Centers for Disease Control and Prevention (CDC); 2003 Louisiana data.
- 2005 PRC National Health Survey, Professional Research Consultants.

**Note:**
- Reflects the total sample of respondents.
Demographic groups which fail to satisfy the Healthy People 2010 target for cholesterol screening include:

- Men.
- Young adults (aged 18 to 39).
- Respondents living at very low income levels.

**Prevalence Of High Blood Cholesterol**

33.7% of adults throughout Grant Parish have been told by a health professional that their cholesterol level was high.

- Similar to that found in regionally (30.1%) and nationwide (32.9%).
- Less favorable that found statewide (22.6%).
- Fails to satisfy the Healthy People 2010 target (17% or lower).

Note that another 17.3% of Grant Parish adults have never had their blood cholesterol tested, meaning that the true prevalence of high blood cholesterol is likely higher still.

**TREND:** Marks a statistically significant increase since 2002.
There is a strong positive correlation with age.

### Prevalence Of High Blood Cholesterol (By Region; 2002-2005 Trend Data)

- **Grant Parish 2005**: 33.7%
- **RFSA 2005**: 30.1%
- **Louisiana 2003**: 22.6%
- **US 2005**: 32.9%

Note that 17.3% of Grant Parish respondents have “never” been tested for high blood cholesterol levels.

### Prevalence Of High Blood Cholesterol (Grant Parish, 2005)

Total Cardiovascular Risk

Individual level risk factors which put people at increased risk for cardiovascular diseases include:

- High Blood Pressure
- High Blood Cholesterol
- Tobacco Use
- Physical Inactivity
- Poor Nutrition
- Overweight/Obesity
- Diabetes

- National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

More than 9 out of 10 Grant Parish adults exhibit one or more cardiovascular risk factors, such as being overweight, smoking cigarettes, being physically inactive, or having high blood pressure or cholesterol.

- Similar to the 88.5% reported nationwide and the 92.4% found throughout the RFSA.

**TREND:** Statistically lower than found in 2002.
By Grant Parish demographics:

- Adults age 40 and older are at much greater risk than younger adults.
- Adults at low or middle/high income levels more often report one or more cardiovascular risk factors.
Three health-related behaviors contribute markedly to cardiovascular disease:

**Poor nutrition.** People who are overweight have a higher risk for cardiovascular disease. Almost 60% of U.S. adults are overweight or obese. To maintain a proper body weight, experts recommend a well-balanced diet which is low in fat and high in fiber, accompanied by regular exercise.

**Lack of physical activity.** People who are not physically active have twice the risk for heart disease of those who are active. More than half of U.S. adults do not achieve recommended levels of physical activity.

**Tobacco use.** Smokers have twice the risk for heart attack of nonsmokers. Nearly one-fifth of all deaths from cardiovascular disease, or about 190,000 deaths a year nationally, are smoking-related. Every day, more than 3,000 young people become daily smokers in the U.S.

Modifying these behaviors is critical both for preventing and for controlling cardiovascular disease. Other steps that adults who have cardiovascular disease should take to reduce their risk of death and disability include adhering to treatment for high blood pressure and cholesterol, using aspirin as appropriate, and learning the symptoms of heart attack and stroke.

– National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

(Related Issues: see also “Nutrition & Overweight,” “Physical Activity & Fitness” and “Tobacco Use” in the Modifiable Health Risk section.)
CANCER

Cancer, the second leading cause of death among Americans, is responsible for one of every four deaths in the United States. In 2005, over half a million Americans—or more than 1,500 people a day—will die of cancer. Black Americans are more likely to die from cancer than people of any other racial or ethnic group.

The financial costs of cancer are staggering. According to the National Institutes of Health, cancers cost the United States more than $170 billion in 2002. This includes more than $110 billion in lost productivity and over $60 billion in direct medical costs.

The number of new cancer cases can be reduced substantially, and many cancer deaths can be prevented. Healthier lifestyles can significantly reduce a person’s risk for cancer—for example, avoiding tobacco use, increasing physical activity, improving nutrition, and avoiding sun exposure. Making cancer screening and information services available and accessible to all Americans is also essential for reducing the high rates of cancer and cancer deaths. Screening tests for breast, cervical, and colorectal cancers reduce the number of deaths from these diseases by finding them early, when they are most treatable. Screening tests for cervical and colorectal cancers can actually prevent these cancers from developing by detecting treatable precancerous conditions.

– National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

Age-Adjusted Cancer Deaths

All Cancer Deaths

Between 2000 and 2002, there was an annual average age-adjusted cancer death rate of 222.6 deaths per 100,000 population in Grant Parish.

- Less favorable than the 196.4 reported nationwide.
- Fails to satisfy the Healthy People 2010 target (159.9 or lower).
- Higher among Blacks/African Americans than among Whites in Grant Parish.

Source: • Louisiana Department of Health & Hospitals; 1997-2001 data.  
Note: • Numbers represent percentage of diagnoses as a ratio of all cancer diagnoses.  
• State and national data not available.
LUNG CANCER

Lung cancer is the most common cause of cancer death among both females and males in the United States. Cigarette smoking is the most important risk factor for lung cancer, accounting for 68 to 78 percent of lung cancer deaths among females and 88 to 91 percent of lung cancer deaths among males. Other risk factors include occupational exposures (radon, asbestos) and indoor and outdoor air pollution (radon, environmental tobacco smoke). One to two percent of lung cancer deaths are attributable to air pollution. After 10 years of abstinence, smoking cessation decreases the risk of lung cancer to 30 to 50 percent of that of continuing smokers.

PROSTATE CANCER

Prostate cancer is the most commonly diagnosed form of cancer (other than skin cancer) in males and the second leading cause of cancer death among males in the United States. Prostate cancer is most common in men aged 65 years and older, who account for approximately 80 percent of all cases of prostate cancer.

Digital rectal examination (DRE) and the prostate-specific antigen (PSA) test are two commonly used methods for detecting prostate cancer. Although several treatment alternatives are available for prostate cancer, their impact on reducing death from prostate cancer when compared with no treatment in patients with operable cancer is uncertain. Efforts aimed at reducing deaths through screening and early detection remain controversial because of the uncertain benefits and potential risks of screening, diagnosis, and treatment.

FEMALE BREAST CANCER

Breast cancer is the most common cancer [diagnosis] among women in the United States. Death from breast cancer can be reduced substantially if the tumor is discovered at an early stage. Mammography is the most effective method for detecting these early malignancies. Clinical trials have demonstrated that mammography screening can reduce breast cancer deaths by 20 to 39 percent in women aged 50 to 74 years and about 17 percent in women aged 40 to 49 years. Breast cancer deaths can be reduced through increased adherence with recommendations for regular mammography screening.

Many breast cancer risk factors, such as age, family history of breast cancer, reproductive history, mammographic densities, previous breast disease, and race and ethnicity, are not subject to intervention. However, being overweight is a well-established breast cancer risk for postmenopausal women that can be addressed. Avoiding weight gain is one method by which older women may reduce their risk of developing breast cancer.

COLORECTAL CANCER

Colorectal cancer (CRC) is the second leading cause of cancer-related deaths in the United States. When cancer-related deaths are estimated separately for males and females, however, CRC becomes the third leading cause of cancer death behind lung and breast cancers for females and behind lung and prostate cancers for males.

Risk factors for CRC may include age, personal and family history of polyps or colorectal cancer, inflammatory bowel disease, inherited syndromes, physical inactivity (colon only), obesity, alcohol use, and a diet high in fat and low in fruits and vegetables. Detecting and removing precancerous colorectal polyps and detecting and treating the disease in its earliest stages will reduce deaths from CRC. Fecal occult blood testing and sigmoidoscopy are widely used to screen for CRC, and barium enema and colonoscopy are used as diagnostic tests.

Lung Cancer Deaths

Between 2000 and 2002, there was an annual average age-adjusted lung cancer death rate of 72.1 deaths per 100,000 population in Grant Parish.

- Similar to the 72.6 found across the RFSA.
- Just above the 67.7 recorded throughout Louisiana.
- Less favorable than the 55.4 recorded across the United States.
- Fails to satisfy the Healthy People 2010 target (72.1 or lower).

Age-Adjusted Mortality: Lung Cancer
(By Region; 2000-2002 Deaths Per 100,000 Population)

Prostate Cancer Deaths

Between 2000 and 2002, there was an annual average age-adjusted prostate cancer death rate of 23.0 deaths per 100,000 population in Grant Parish.

- The rate across the RFSA was 32.0.
- Statewide, prostate cancer claimed 34.7 lives per 100,000 population.
- The U.S. rate (29.1) was similar to the Healthy People 2010 objective of 28.8 or lower.

Age-Adjusted Mortality: Prostate Cancer
(By Region; 2000-2002 Deaths Per 100,000 Male Population)

Female Breast Cancer Deaths

Between 2000 and 2002, there was an annual average age-adjusted female breast cancer death rate of 23.0 deaths per 100,000 female population in Grant Parish.

- Lower than the RFSA (27.3), state (30.2) and national (26.1) rates.
- Close to the Healthy People 2010 target (22.3 or lower).

Colorectal Cancer Deaths

Between 2000 and 2002, there was an annual average age-adjusted colorectal cancer death rate of 20.5 deaths per 100,000 population in Grant Parish.

- The rate across the RFSA was 23.3, similar to the 23.5 reported across Louisiana.
- The U.S. rate was a lower 20.2 for the same time period.
- Fails to satisfy the related Healthy People 2010 objective of 13.9 or lower.
**Prevalence Of Cancer**

A total of 5.4% of surveyed adults report having been diagnosed with cancer.

- Similar to the 5.6% reported across the RFSA.
- Most common types of cancers reported include breast, colon, and prostate cancer.

![Prevalence Of Cancer](image)

Source: 2005 PRC Community Health Survey, Professional Research Consultants. [Item 38]
Note: Asked of all respondents.

Reducing the nation’s cancer burden requires reducing the prevalence of behavioral and environmental factors that increase cancer risk.

- All cancers caused by cigarette smoking could be prevented. At least one-third of cancer deaths that occur in the United States are due to cigarette smoking.
- According to the American Cancer Society, about one-third of cancer deaths that occur in the United States each year are due to nutrition and physical activity factors, including obesity.

– National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

(Related Issues: see also “Nutrition & Overweight,” “Physical Activity & Fitness” and “Tobacco Use” in the Modifiable Health Risk section.)

**Cancer Screenings**

The American Cancer Society recommends that both men and women get a cancer-related checkup as part of a routine doctor’s checkup. It should include examination for cancers of the thyroid, testicles, ovaries, lymph nodes, oral cavity, and skin, as well as health counseling about tobacco, sun exposure, diet and nutrition, risk factors, sexual practices, and environmental and occupational exposures.

Screening levels in the parish were measured in the survey relative to four cancers: colorectal cancer (sigmoidoscopy and fecal occult blood testing); female breast cancer (mammography); cervical cancer (Pap smear testing); and prostate cancer (prostate-specific antigen testing and digital rectal examination).
Colorectal Cancer Screenings

Beginning at age 50, both men and women should follow one of these five testing schedules:

- Yearly fecal occult blood test (FOBT)*
- Flexible sigmoidoscopy every 5 years
- Yearly fecal occult blood test plus flexible sigmoidoscopy every 5 years**
- Double-contrast barium enema every 5 years
- Colonoscopy every 10 years

*For FOBT, the take-home multiple sample method should be used.
**The combination of FOBT and flexible sigmoidoscopy is preferred over either of these two tests alone.

All positive tests should be followed up with colonoscopy. People should begin colorectal cancer screening earlier and/or undergo screening more often if they have certain colorectal cancer risk factors.

— American Cancer Society

Note that other organizations (e.g., American Academy of Family Physicians, American College of Physicians, National Cancer Institute, US Preventive Services Task Force) may have slightly different screening guidelines.

Sigmoidoscopy/Colonoscopy

61.0% of adults aged 50 and older have had a sigmoidoscopy (or colonoscopy) at some point in their lives.

- More favorable than the 52.9% reported throughout the RFSA and the 44.8% reported throughout Louisiana.
- Similar to the U.S. prevalence of 65.4%.
- Satisfies the Healthy People 2010 target (50% or higher).
- Includes 62.4% of Grant Parish men 50+ and 59.5% of Grant Parish women 50+.

** TREND: Significantly higher than the 47.6% reported across the parish in 2002.

![Graph showing sigmoidoscopy/colonoscopy examination data]
**Blood Stool Testing**

40.5% of surveyed adults aged 50 and older have had a blood stool test (a.k.a. fecal occult blood test) within the past two years.

- Comparable to the 35.4% reported across the RFSA and the 36.7% found nationwide.
- More favorable than the 29.4% reported in Louisiana.
- Fails to satisfy the Healthy People 2010 target (50% or higher).
- Includes 38.4% of men 50+ and 42.8% of women 50+.

**TREND:** Similar to the 42.6% recorded in 2002.

---

Note: • Asked of all respondents aged 50 or over.
Female Breast Cancer Screening

Screenings for female breast cancer are recommended as outlined below:

- Baseline mammogram at age 40, then yearly thereafter, continuing for as long as a woman is in good health.
- Clinical breast exams (CBE) should be part of a periodic health exam, about every three years for women in their 20s and 30s and every year for women 40 and over.
- Women should report any breast change promptly to their healthcare providers. Breast self-exam (BSE) is an option for women starting in their 20s.
- Women at increased risk (e.g., family history, genetic tendency, past breast cancer) should talk with their doctors about the benefits and limitations of starting mammography screening earlier, having additional tests (e.g., breast ultrasound or MRI), or having more frequent exams.

– American Cancer Society

Note that other organizations (e.g., American Academy of Family Physicians, American College of Physicians, National Cancer Institute, US Preventive Services Task Force) may have slightly different screening guidelines.

Mammography

75.0% of women aged 40 and older have had a mammogram within the past two years.

- Comparable to each of the other four demographic regions.
- Satisfies the Healthy People 2010 target (70% or higher).

**TREND:** This year’s proportion is not statistically different from 2002 data.

Cervical Cancer Screenings

Screenings for cervical cancer are recommended as outlined below:

- All women should begin cervical cancer screening about 3 years after they begin having vaginal intercourse, but no later than when they are 21 years old. Screening should be done every year with the regular Pap test or every 2 years using the newer liquid-based Pap test.

- Beginning at age 30, women who have had 3 normal Pap test results in a row may get screened every 2 to 3 years with either the conventional (regular) or liquid-based Pap test. Women who have certain risk factors such as diethylstilbestrol (DES) exposure before birth, HIV infection, or a weakened immune system due to organ transplant, chemotherapy, or chronic steroid use should continue to be screened annually.

- Another reasonable option for women over 30 is to get screened every 3 years (but not more frequently) with either the conventional or liquid-based Pap test, plus the HPV DNA test.

- Women 70 years of age or older who have had 3 or more normal Pap tests in a row and no abnormal Pap test results in the last 10 years may choose to stop having cervical cancer screening. Women with a history of cervical cancer, DES exposure before birth, HIV infection or a weakened immune system should continue to have screening as long as they are in good health.

- Women who have had a total hysterectomy (with removal of the uterus and cervix) may also choose to stop having cervical cancer screening, unless the surgery was done as a treatment for cervical cancer or precancer.

— American Cancer Society

Note that other organizations (e.g., American Academy of Family Physicians, American College of Physicians, National Cancer Institute, US Preventive Services Task Force) may have slightly different screening guidelines.

Pap Smear Testing

76.2% of women aged 18 and older have had a Pap smear within the past three years.

- Less favorable than the 85.2% reported statewide.
- Fails to satisfy the Healthy People 2010 target (90% or higher).

**TREND:** The current proportion is similar to the proportion from 2002.

![Graph showing percentage of women who had a Pap smear within the past three years by region.](image-url)
### Prostate Cancer Screenings

Both prostate-specific antigen (PSA) testing and digital rectal examination (DRE) should be offered annually, beginning at age 50, to men who have at least a 10-year life expectancy. Men at high risk should begin testing at age 45. Information should be provided to men regarding potential risks and benefits of early detection and treatment of prostate cancer. Men at even higher risk, due to multiple first-degree relatives affected at an early age, could begin testing at age 40. Depending on the results of this initial test, no further testing might be needed until age 45. Information should be provided to men regarding potential risks and benefits of early detection and treatment of prostate cancer.

- Men who choose to undergo testing should begin at age 50 years. However, men in high-risk groups, such as Black Americans and men who have a first-degree relative diagnosed with prostate cancer at a young age, should begin testing at 45 years. *Note: a first-degree relative is defined as a father, brother, or son.*
- Men who ask their doctor to make the decision on their behalf should be tested. Discouraging testing is not appropriate. Also not offering testing is not appropriate.
- Testing for prostate cancer in asymptomatic men can detect tumors at a more favorable stage (anatomic extent of disease). There has been a reduction in mortality from prostate cancer, but it has not been established that this is a direct result of screening.
- An abnormal Prostate-Specific Antigen (PSA) test result has been defined as a value of above 4.0 ng/ml. Some elevations in PSA may be due to benign conditions of the prostate.
- The Digital Rectal Examination (DRE) of the prostate should be performed by healthcare workers skilled in recognizing subtle prostate abnormalities, including those of symmetry and consistency, as well as the more classic findings of marked induration or nodules. DRE is less effective in detecting prostate carcinoma compared with PSA.

– American Cancer Society

*Note that other organizations (e.g., American Academy of Family Physicians, American College of Physicians, National Cancer Institute, US Preventive Services Task Force) may have slightly different screening guidelines.*

### PSA Testing And/Or Digital Rectal Examination

**75.4% of surveyed men aged 50 and older had a PSA (prostate-specific antigen) test and/or a digital rectal exam to check for prostate cancer within the past two years.**

- Similar to the 75.1% recorded throughout the RFSA and the 85.1% reported among men 50+ across the nation.

**TREND:** This year’s finding is statistically unchanged from 2002.

RESPIRATORY DISEASE

Asthma and COPD (chronic obstructive pulmonary disease) are among the 10 leading chronic conditions causing restricted activity in Americans. After chronic sinusitis, asthma is the most common cause of chronic illness in children. Methods are available to treat these respiratory diseases and promote respiratory health.

- Asthma is a serious and growing health problem. An estimated 14.9 million persons in the United States have asthma. Asthma is responsible for about 500,000 hospitalizations, 5,000 deaths, and 134 million days of restricted activity a year. Yet most of the problems caused by asthma could be averted if persons with asthma and their healthcare providers managed the disease according to established guidelines.

- Inflammation of the airways is the common finding in all asthma patients. Recent studies indicate that this inflammation is virtually always causative in the asthmatic condition. This inflammation is produced by allergy, viral respiratory infections, and airborne irritants among others. Childhood asthma is a disorder with genetic predispositions and a strong allergic component. Approximately 75% to 80% of children with asthma have significant allergies.

- COPD includes chronic bronchitis and emphysema—both of which are characterized by irreversible airflow obstruction and often exist together. Similar to asthma, COPD may be accompanied by an airway hyperresponsiveness. Most patients with COPD have a history of cigarette smoking. COPD worsens over time with continued exposure to a causative agent—usually tobacco smoke or sometimes a substance in the workplace or environment. COPD occurs most often in older people.

[Note: Chronic lower respiratory disease (CLRD) was called chronic obstructive pulmonary disease (COPD) prior to 1999 with the issuance of the International Classification of Diseases, Tenth Revision (ICD-10). Healthy People 2010 refers to COPD rather than CLRD.]

Age-Adjusted Respiratory Disease Deaths

Chronic Lower Respiratory Disease (CLRD) Deaths

Between 2000 and 2002, there was an annual average age-adjusted CLRD death rate of 64.8 deaths per 100,000 population in Grant Parish.

- Less favorable than the 51.4 reported regionally, the 41.9 rate reported statewide, and the 43.8 nationwide.

- Much higher among Whites (67.1) than Blacks/African Americans (52.0) when viewed by race/ethnicity.
**TREND**: Age-adjusted mortality due to CLRD trended upward in recent years.

- Note: Death rates before and after 1998 are not fully comparable due to changes in the death coding system beginning in 1999.
Pneumonia/Influenza Deaths

Between 2000 and 2002, there was an annual average age-adjusted pneumonia/influenza death rate of 43.2 deaths per 100,000 population in Grant Parish.

- Much higher than reported across the RFSA, Louisiana and the United States.
- Higher among Blacks/African Americans than among Whites.

TREND: Pneumonia/influenza death rates trended downward in recent years.

(For prevalence of vaccinations for pneumonia and influenza, see also “Immunization & Infectious Disease.”)
Prevalence Of Asthma

11.2% of Grant Parish adults report having been diagnosed with asthma.

- Statistically comparable to each of the other four demographic regions.

**TREND:** Comparable to the 9.7% in 2002.

![Prevalence Of Asthma Chart](chart.png)

Among respondents having been diagnosed with asthma, 66.8% report that they still have this condition.

Asthma In Children

While the number of adults with asthma is greater than the number of children with asthma, the asthma rate is rising more rapidly in preschool-aged children than in any other group.

In all, 19.4% of surveyed parents report that their child (aged 0 to 17) has been diagnosed with asthma.

- Statistically similar to the 15.5% found throughout the RFSA.
- Less favorable than both the 11.1% reported nationwide.

**TREND:** Has not changed significantly since 2002.
Prevalence Of Chronic Lung Disease

A total of 12.7% of survey respondents report suffering from chronic lung disease.

- Comparable throughout the RFSA (10.1%).
- Less favorable than the 8.6% reported nationwide.

**TREND:** Statistically unchanged from the 9.9% found in Grant Parish in 2002.
The risk of injury is so great that most persons sustain a significant injury at some time during their lives. Nevertheless, this widespread human damage too often is taken for granted, in the erroneous belief that injuries happen by chance and are the result of unpreventable “accidents.” In fact, many injuries are not “accidents,” or random, uncontrollable acts of fate; rather, most injuries are predictable and preventable.

For ages 1 through 44 years, [U.S.] deaths from injuries far surpass those from cancer—the overall leading natural cause of death at these ages—by about three to one. Injuries cause more than two out of five deaths (43 percent) of children aged 1 through 4 years and result in four times the number of deaths due to birth defects, the second leading cause of death for this age group. For ages 15 to 24 years, injury deaths exceed deaths from all other causes combined from ages 5 through 44 years. For ages 15 to 24 years, injuries are the cause of nearly four out of five deaths. After age 44 years, injuries account for fewer deaths than other health problems, such as heart disease, cancer, and stroke. However, despite the decrease in the proportion of deaths due to injury, the death rate from injuries is actually higher among older persons than among younger persons.

**Unintentional Injury**

**Leading Causes Of Accidental Deaths**

Motor vehicle crashes accounted for 37.5% of all accidental deaths in Grant Parish in 2002.

- Smoke/fire, poisoning (including accidental poisonings, overdoses, and drug interactions), and falls are also leading causes of accidental death throughout Grant Parish.
- “Other” includes a variety of less common causes, such as medical/surgical complications, firearm-related accidental deaths, non-motor vehicle transportation accidents, etc.

Age-Adjusted Unintentional Injury Deaths

Between 2000 and 2002, there was an annual average age-adjusted unintentional injury death rate of 48.0 deaths per 100,000 population in Grant Parish.

- Similar to the 48.6 found throughout the RFSA and the 46.8 throughout Louisiana during the same time period.
- Less favorable than the 35.8 reported nationwide.
- Fails to satisfy the Healthy People 2010 target (159.9 or lower).
- Higher among Whites (52.6) than Blacks/African Americans (19.3).

**TREND:** Death rates due to unintentional injuries decreased in the past 10 years in Grant Parish.
Age-Adjusted Motor-Vehicle Related Deaths

Between 2000 and 2002, there was an annual average age-adjusted motor vehicle accident death rate of 22.0 deaths per 100,000 population in Grant Parish.

- Just below the RFSA (24.6) rate.
- Identical to the state (22.0) rate.
- Significantly higher than the rate reported nationwide (15.5).
- Fails to satisfy the Healthy People 2010 target (9.2 or lower).
- Note that there were no motor vehicle deaths among Blacks/African Americans between 2000 and 2002.

Age-Adjusted Mortality: Motor Vehicle Accidents
(By Region And Race; 2000-2002 Deaths Per 100,000 Population)

Source: • CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted July 2005.

Note: • Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
• Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
• Parish, state and national data are simple three-year averages, the RFSA three-year averages are weighted by population.

By age, motor vehicle accident death rates in Grant Parish (1993-2002) are highest in the 15 to 19 age group, and second-highest in the 65 to 74 age group.

Motor Vehicle Accidents
(Grant Parish; By Age; 1993-2002 Crude Death Rate)

Source: • CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted December 2005.
Note: • Deaths are coded using the Ninth and Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems.
• Rates are per 100,000 population within each age group.
**TREND:** Overall, Grant Parish motor vehicle accident death rates decreased slightly in recent years. This trend is mirrored in state and national data. Note the rise then fall of motor vehicle accident deaths in the late 1990s in Grant Parish.

2005 PRC COMMUNITY HEALTH ASSESSMENT
The following chart illustrates differences among key demographic groups. Note:

- Female respondents are more likely to report seat belt use than are male respondents.
- There is a positive relationship of seat belt use with age: 64.7% of young adults (aged 18 to 39) “always” wear a seat belt, compared to 77.1% among those aged 49 to 64, and 74.5% among those aged 65 and older.
- Those living at very low incomes and middle to high incomes are more likely to report consistent seat belt usage.

Note: • Asked of all respondents.
• Income categories reflect respondent’s household income as a ratio to the federal poverty level for their household size: "very low income" = below poverty; "low income" = 100% to 200% of poverty; "middle/high income" = over 200% of poverty.

**Children**

More than nine out of 10 Grant Parish parents (91.5%) report that their child (aged 0 to 17) “always” wears an appropriate seat belt or child restraint (e.g., safety seat) when riding in an automobile.

- Similar to the overall RFSA prevalence (87.7%).
- More positive than U.S. findings (81.3%).
- Similar to the Healthy People 2010 target for children ages 5 to 17 (92% or higher for those aged 5 through 17).
- Satisfies the Healthy People 2010 target for children under 5 (100% for children under 5).

**TREND:** Statistically unchanged since 2002.

**Intentional Injury (Violence)**

### Age-Adjusted Intentional Injury Deaths

**Homicide**

Between 2000 and 2002, there was an annual average age-adjusted homicide death rate of 9.3 deaths per 100,000 population in Grant Parish.

- Higher than the regional rate (7.5).
- Lower than the statewide rate (12.8).
- Much higher than the national rate (6.4).
- Three times the Healthy People 2010 target (3.0 or lower).
- Note that there were no homicide deaths among Blacks/African Americans between 2000 and 2002.

Source: • CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted December 2005.

Note: • Deaths are coded using the Ninth and Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems.
• Rates are per 100,000 population within each age group.

**Healthy People 2010 objective is 5.0 or lower**

(See also “Mental Health.”)
Violent Crime Rates

Violence claims the lives of many of the Nation’s young persons and threatens the health and well-being of many persons of all ages in the United States. On an average day in America, 53 persons die from homicide, and a minimum of 18,000 persons survive interpersonal assaults, 84 persons complete suicide, and as many as 3,000 persons attempt suicide.

Youth continue to be involved as both perpetrators and victims of violence. Elderly persons, females, and children continue to be targets of both physical and sexual assaults, which are frequently perpetrated by individuals they know.

The 2001-2003 Grant Parish annual average violent crime rate (including homicide, forcible rape, robbery and aggravated assault) was 248.6 per 100,000 population.

- Significantly more favorable than the 551.9 regionally, the 665.2 statewide rate, and the 491.3 reported nationwide.

**TREND:** The violent crime rate in Grant Parish appears to have decreased in recent years, similar to the downward trend reported across the nation.

- It is important to note that, although uniform crime reporting is mandatory in Louisiana, not all agencies within each parish reported for all years.

• Louisiana Commission on Law Enforcement.

Note: • Rates are per 100,000 population.
• Includes only agencies reporting. Although uniform crime reporting is mandatory in Louisiana, not all agencies within each parish reported for some or all years.
• 1997 and 1998 rates exclude Catahoula Parish for which reporting was not available at the time rates were calculated.
Violent Crime Victimization

Just 1.5% of Grant Parish adults report having been the victim of a violent crime in the past five years.

- Similar to the prevalence reported throughout the RFSA.
- Identical to the 1.5% prevalence found nationwide.
- Represents approximately 230 adults in Grant Parish.

**TREND:** Statistically unchanged since 2002.

Domestic Violence

A total of 1.3% of Grant Parish adults acknowledge being the victim of domestic violence in the past five years.

- Statistically more favorable than reported regionally (2.7%).
- Statistically similar to the nation (due to sampling sizes the nationwide rate holds a higher margin of error).

**TREND:** Statistically unchanged since 2002.
Diabetes affects nearly 16 million Americans and contributes to about 200,000 deaths a year. Diabetes can cause heart disease, stroke, blindness, kidney failure, leg and foot amputations, pregnancy complications, and deaths related to influenza and pneumonia. About 5.4 million Americans are unaware they have the disease.

- Among U.S. adults, diagnosed diabetes (including gestational diabetes) increased 49% from 1990 to 2000. The largest increase was among people aged 30–39. Type 2 affects 90%–95% of people with diabetes and is linked to obesity and physical inactivity.
- More than 18% of U.S. adults older than age 65 have diabetes.
- Diabetes affects more women than men — in particular, women are prone to gestational diabetes during (and potentially ongoing diabetes after) pregnancy.

The direct and indirect costs of diabetes in America are nearly $100 billion a year.

– National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

### Age-Adjusted Diabetes Deaths

Between 2000 and 2002, there was an annual average age-adjusted diabetes death rate of 50.5 deaths per 100,000 population in Grant Parish.

- Considerably higher than the regional rate (34.0), the Louisiana rate (41.8), and the national rate (25.2).
- Fails to satisfy the Healthy People 2010 objective of 15.1 or lower for diabetes mellitus.
- Higher (98.8) among Blacks/African Americans than Whites (43.9) in Grant Parish.

### Age-Adjusted Mortality: Diabetes Mellitus

(By Region And Race; 2000-2002 Deaths Per 100,000 Population)

Source: • CDC WONDER Online Query System.  Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics.  Data extracted July 2005.

Note: • Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
- Parish, state and national data are simple three-year averages, the RFSA three-year averages are weighted by population.
- *The Healthy People 2010 target for Diabetes is adjusted to account for only diabetes mellitus coded deaths.
**TREND:** Diabetes is on an upward trend across the parish and the entire RFSA; local and regional trends are also increasing more sharply than those seen nationally.

### Prevalence Of Diabetes

A total of **13.7%** of Grant Parish adults report having been diagnosed with diabetes.

- Higher than the prevalence statewide (**8.2%**).
- Comparable to the **10.2%** prevalence recorded across the United States.

**TREND:** Statistically unchanged in Grant Parish over the past few years.
A higher prevalence of diabetes in Grant Parish is reported among:

- Adults aged 40 and older (especially those aged 65 and older).
- Note also that diabetes is highly correlated with weight status: in particular, obese adults report a prevalence of diabetes five times that found among persons of healthy weight.

**Prevalence Of Diabetes**

KIDNEY DISEASE

Age-Adjusted Kidney Disease Deaths

Between 2000 and 2002, there was an annual average age-adjusted kidney disease death rate of 26.9 deaths per 100,000 population in Grant Parish.

- Similar to the RFSA rate (26.2), but higher than the statewide rate (21.6).
- Nearly twice the national rate (13.9).
- Note that kidney disease mortality is twice as high among Whites than among Blacks/African Americans.

Prevalence Of Kidney Disease

A total of 4.6% of Grant Parish adults report having kidney disease.

- Similar to the RFSA proportion (3.7%).

**TREND:** The currently reported prevalence is statistically similar to that reported in 2002.

**Prevalence Of Kidney Disease**

(By Region; 2002-2005 Trend Data)

Source: • PRC Community Health Surveys, Professional Research Consultants. [Item 40]

Note: • Asked of all respondents.
• State and national data not available.
The current and projected growth in the number of people aged 65 years and older in the United States has focused attention on preserving quality of life as well as length of life. Chief among the factors involving preserving quality of life are the prevention and treatment of musculoskeletal conditions—the major causes of disability in the United States. Among musculoskeletal conditions, arthritis and other rheumatic conditions, osteoporosis, and chronic back conditions have the greatest impact on public health and quality of life.

A total of 33.3% of Grant Parish adults (aged 18 and over) report suffering from arthritis or rheumatism.

- Less favorable than the 22.7% reported across the United States.
  - Note: 66.6% of parish adults aged 65 and older have arthritis or rheumatism.

**TREND:** Statistically unchanged from the 32.6% reported in 2002.
### ACTIVITY LIMITATIONS

An estimated 54 million persons in the United States, or nearly 20 percent of the population, currently live with disabilities. The increase in disability among all age groups indicates a growing need for public health programs serving people with disabilities.

The direct medical and indirect annual costs associated with disability [in the U.S.] are more than $300 billion, or 4 percent of the gross domestic product. This total cost includes $160 billion in medical care expenditures (1994 dollars) and lost productivity costs approaching $155 billion.

The health promotion and disease prevention needs of people with disabilities are not nullified because they are born with an impairing condition or have experienced a disease or injury that has long-term consequences. People with disabilities have increased health concerns and susceptibility to secondary conditions. Having a long-term condition increases the need for health promotion that can be medical, physical, social, emotional, or societal.

---

25.3% of Grant Parish adults report that they are limited in some way in some activities due to a physical, mental or emotional problem.

- Comparable to the 24.6% reported regionally and 19.8% reported nationwide.
- Represents more than 3,870 adults in Grant Parish.

**TREND:** Significantly higher than the 21.1% reported in Grant Parish in 2002.

#### Limited In Activities In Some Way Due To A Physical, Mental Or Emotional Problem

- PRC Community Health Surveys, Professional Research Consultants. [Item 106]  
- 2005 PRC National Health Survey, Professional Research Consultants.

Note:  
- Asked of all respondents.  
- State data not available.
In looking at responses by key demographic characteristics, note the following:

- There is a strong relationship with age, with 32.7% of middle-aged adults and 34.7% of older adults (65+) limited in activities.
- There is a strong negative correlation with income, with 41.0% of very low-income respondents reporting activity limitations.

**Limited In Activities In Some Way Due To A Physical, Mental Or Emotional Problem**
(Grant Parish, 2005)

Among persons reporting activity limitations, these are most often attributed to heart problems or back/neck problems.

**Type Of Problem That Limits Activities**
(Among Those Reporting Activity Limitations; Grant Parish, 2005)

Source: • 2005 PRC Community Health Survey, Professional Research Consultants. [Item 106]
Note: • Asked of all respondents.
      • Income categories reflect respondent's household income as a ratio to the federal poverty level for their household size:
        *very low income* = below poverty; *low income* = 100% to 200% of poverty; *middle/high income* = over 200% of poverty.

Source: • 2005 PRC Community Health Survey, Professional Research Consultants. [Item 107]
Note: • Reflects those respondents who experience activity limitations.
Among the five senses, people depend on vision and hearing to provide the primary cues for conducting the basic activities of daily life. At the most basic level, vision and hearing permit people to navigate and to stay oriented within their environment. These senses provide the portals for language, whether spoken, signed, or read. They are critical to most work and recreation and allow people to interact more fully. For these reasons, vision and hearing are defining elements of the quality of life. Either, or both, of these senses may be diminished or lost because of heredity, aging, injury, or disease. Such loss may occur gradually, over the course of a lifetime, or traumatically in an instant.

Conditions of vision or hearing loss that are linked with chronic and disabling diseases pose additional challenges for patients and their families. From the public health perspective, the prevention of either the initial impairment or additional impairment from these environmentally orienting and socially connecting senses requires significant resources. Prevention of vision or hearing loss or their resulting disabling conditions through the development of improved disease prevention, detection, or treatment methods or more effective rehabilitative strategies must remain a priority.

Prevalence Of Vision Problems

A total of 12.9% of Grant Parish adults are blind, or have trouble seeing even when wearing corrective lenses.

- Significantly higher than the 8.1% prevalence reported nationwide.

**TREND:** The 2005 proportion is comparable to the 12.8% reported in Grant Parish in 2002.

Prevalence Of Vision Problems

(By Region; 2002-2005 Trend Data)

Prevalence Of Hearing Problems

A total of 13.7% of parish adults report being deaf or having difficulty hearing.

- Significantly higher than the 9.5% reported nationwide.
  - Note: 24.2% of Grant Parish adults aged 65 and older have partial or complete hearing loss.

**TREND:** Unchanged from the 13.1% reported in Grant Parish in 2002.

Prevalence Of Hearing Problems
(By Region; 2002-2005 Trend Data)

Source: • PRC Community Health Surveys, Professional Research Consultants. [Item 34]
• 2005 PRC National Health Survey, Professional Research Consultants.

Note: • Asked of all respondents.
• State data not available.
A landmark 1993 study estimated that as many as one-half of all premature deaths in the United States were attributed to social and behavioral factors, and in theory, were preventable.

The most prominent contributors to mortality in the United States in 1990 were tobacco (an estimated 400,000 deaths), poor diet and inactivity (300,000), alcohol (100,000), microbial agents (90,000), toxic agents (60,000), firearms (35,000), sexual behavior (30,000), motor vehicles (25,000), and illicit use of drugs (20,000). Socioeconomic status and access to medical care are also important contributors, but difficult to quantify independent of the other factors cited. Because the studies reviewed used different approaches to derive estimates, the stated numbers should be viewed as first approximations… Approximately half of all deaths that occurred among U.S. residents in 1990 could be attributed to the [social and behavioral risk] factors identified…

There can be no illusions about the difficulty of the challenges in changing the impact these factors have on health status. Of those identified here, the three leading causes of death — tobacco, diet and activity patterns, and alcohol — are rooted in behavioral choices. Behavioral change is motivated not by knowledge alone, but also by a supportive social environment and the availability of facilitative services…

The central public health focus for each of these factors must be the possibility for improvement. Change can occur… If the nation is to achieve its full potential for better health, public policy must focus directly and actively on those factors that represent the root determinants of death and disability.

Further, the following table outlines the relationship that exists among these behavioral factors and leading causes of death, such as cancer and heart disease.

<table>

Notes: 1. Leading causes of death are those which are listed on the death certificate. 2. High blood pressure and obesity can be thought of as "intermediary" causes. Both are determined in part by genetics and in part by behavior. Diet and physical activity are important determinants of obesity.

For the nutrition question series, survey respondents were asked about the foods that they ate on the day prior to the interview.

**Consumption Of Fruits & Vegetables**

*Daily Recommendation*

More than one-fourth (28.0%) of Grant Parish adults reports eating five or more servings of fruits and/or vegetables per day.

- Similar to the 32.4% reported across the RFSA.
- Less favorable than the 36.2% reported nationwide.

**TREND:** Statistically unchanged from the 28.6% in 2002.

**Consume Five Or More Servings Of Fruits/Vegetables Per Day**

(By Region; 2002-2005 Trend Data)

Source: • PRC Community Health Surveys, Professional Research Consultants. [Item 139]  
• 2005 PRC National Health Survey, Professional Research Consultants.

Note: • Asked of all respondents.  
• For this issue, respondents were asked to recall the foods they had eaten on the day prior to the interview.
The following chart further examines fruit/vegetable consumption by various demographic characteristics. As shown, respondents less likely to eat five or more fruits/vegetables per day include:

- Men.
- Adults under 65.

**Fruits**

A little more than one-third of Grant Parish residents (37.0%) report eating at least two servings of fruit or fruit juice per day.

- Less favorable than the 45.7% found for the RFSA overall and the 46.5% found nationally.
- Fails to satisfy the Healthy People 2010 target (75% or higher).

**TREND:** Statistically similar to 2002 findings.
Vegetables
More than one-half (52.7%) of Grant Parish adults do not eat any dark green or orange vegetables on a daily basis.

- Another 24.7% report eating one serving of dark green or orange vegetables daily.
- Survey respondents were more likely to report eating “other vegetables,” including potatoes, corn, onions, etc.

### Daily Servings Of Vegetables
(Grant Parish, 2005)

#### Dark Green or Orange Vegetables
Mean = 0.8 Servings/Day
- None: 52.7%
- One: 24.7%
- Two: 17.0%
- Three to Five: 5.6%

#### “Other” Vegetables
Mean = 1.3 Servings/Day
- None: 25.0%
- One: 34.1%
- Two: 30.5%
- Three to Five: 10.1%
- Six+: 0.4%

Source: 2005 PRC Community Health Survey, Professional Research Consultants. [Item 91-92]
Note: Asked of all respondents. For this issue, respondents were asked to recall the foods they had eaten on the day prior to the interview.

Children’s Consumption Of Fast Food
Among Grant Parish parents of children between the ages of 5 and 17, 30.4% report that their child eats three or more fast food meals per week.

- Comparable to the 34.7% reported throughout the RFSA.

**TREND**: Comparable to the 29.3% reported in Grant Parish in 2002.

### Child Eats Three Or More Fast Food Meals Per Week
(By Region; 2002-2005 Trend Data)

Source: PRC Community Health Surveys, Professional Research Consultants. [Item 130]
Note: Asked of all respondents with children between the ages of 5 and 17 at home. State and national data not available.
Body Weight

Body Mass Index (BMI), which describes relative weight for height, is significantly correlated with total body fat content. The BMI should be used to assess overweight and obesity and to monitor changes in body weight. In addition, measurements of body weight alone can be used to determine efficacy of weight loss therapy. BMI is calculated as weight (kg)/height squared (m²). To estimate BMI using pounds and inches, use: \[\text{BMI} = \frac{\text{weight (pounds)}}{(\text{height} \text{ inches})^2} \times 703.\]

In this report, overweight is defined as a BMI of 25.0 to 29.9 kg/m² and obesity as a BMI of \(\geq 30\) kg/m². The rationale behind these definitions is based on epidemiological data that show increases in mortality with BMIs above 25 kg/m². The increase in mortality, however, tends to be modest until a BMI of 30 kg/m² is reached. For persons with a BMI of \(\geq 30\) kg/m², mortality rates from all causes, and especially from cardiovascular disease, are generally increased by 50 to 100 percent above that of persons with BMIs in the range of 20 to 25 kg/m².

Overweight and obesity result from a complex interaction between genes and the environment characterized by long-term energy imbalance due to a sedentary lifestyle, excessive caloric consumption, or both. They develop in a socio-cultural environment characterized by mechanization, sedentary lifestyle, and ready access to abundant food. Attempts to prevent overweight and obesity are difficult to both study and achieve.

Healthy Weight

Based on self-reported heights and weights, one-third (35.1%) of Grant Parish adults are at a healthy weight (neither underweight nor overweight, BMI = 18.5-24.9).

- Similar to the other four demographic regions.
- Far from reaching the Healthy People 2010 target (60% or higher).

\(\text{TREND: Statistically higher}\) than the 27.7% reported in 2002.
Healthy Weight
(Body Mass Index Between 18.5 And 24.9; By Region; 2002-2005 Trend Data)

Overweight Status

Adults
A total of 63.6% of Grant Parish adults are overweight (BMI ≥ 25), including 28.5% who are obese (BMI ≥ 30).

- Comparable to the proportion of overweight reported throughout the RFSA (67.5%).
- Comparable to the proportion of overweight reported across the U.S. (66.1%).
- Fails to satisfy the Healthy People 2010 target for obesity (15% or lower).

**TREND:** Parish proportions of overweight are statistically more favorable than in 2002.

Source: • PRC Community Health Surveys, Professional Research Consultants. [Item 135]
• 2005 PRC National Health Survey, Professional Research Consultants.

Note: • Based on self-reported height and weight, asked of all respondents. • The definition of healthy weight is having a body mass index (BMI), a ratio of weight to height (kilograms divided by meters squared), between 18.5 and 24.9.
The following chart further examines parish obesity by various demographic characteristics. As shown, adults aged 40 through 64 are more likely to be obese.

### Prevalence Of Obesity

(Grant Parish, 2005)

![Chart showing prevalence of obesity by various demographic characteristics.](chart-image)

**Source:** • 2005 PRC Community Health Survey, Professional Research Consultants. [Item 135]

**Note:** • Based on self-reported height and weight, asked of all respondents.
• The definition of obesity is having a body mass index (BMI), a ratio of weight to height (kilograms divided by meters squared), greater than or equal to 30.0.
• Income categories reflect respondent's household income as a ratio to the federal poverty level for their household size:
  *very low income* = below poverty; *low income* = 100% to 200% of poverty; *middle/high income* = over 200% of poverty.

### Health Professional Advice About Weight

A total of 19.5% of Grant Parish adults report that their physician, nurse or other health professional has given them advice in the past year about their weight.

- This proportion increases to 35.2% among obese Grant Parish adults.

### Have Received Advice About Weight In The Past Year From A Physician, Nurse Or Other Health Professional

(Grant Parish, 2005)

![Chart showing proportion of adults who received advice about weight.](chart-image)

**Source:** • 2005 PRC Community Health Survey, Professional Research Consultants. [Item 101]

**Note:** • Asked of all respondents.
• State and national data not available.
• Income categories reflect respondent's household income as a ratio to the federal poverty level for their household size:
  *very low income* = below poverty; *low income* = 100% to 200% of poverty; *middle/high income* = over 200% of poverty.
Weight Control

Many diseases are associated with overweight and obesity. Persons who are overweight or obese are at increased risk for high blood pressure, type 2 diabetes, coronary heart disease, stroke, gallbladder disease, osteoarthritis, sleep apnea, respiratory problems, and some types of cancer. The health outcomes related to these diseases, however, often can be improved through weight loss or, at a minimum, no further weight gain. Total costs (medical costs and lost productivity) attributable to obesity alone amounted to an estimated $99 billion in 1995.

28.5% of Grant Parish adults who are overweight say that they are both modifying their diet and increasing their physical activity in order to lose weight.

- Much less favorable than the 39.4% reported nationally.
- Among obese Grant Parish adults: 36.8% are trying to lose weight through a combination of diet and exercise, similar to the RFSA finding, but less favorable than nationwide.

Trying To Lose Weight By Both Modifying Diet And Increasing Physical Activity
(Among Respondents Who Are Overweight; By Weight Status; By Region, 2005)

Source: • 2005 PRC Community Health Survey, Professional Research Consultants. [Item 136]
• 2005 PRC National Health Survey, Professional Research Consultants.
Note: • Reflected responses among overweight respondents (categories are not mutually exclusive).
Relationship Of Overweight With Other Health Issues

The correlation between overweight and various health issues cannot be disputed.

Among Grant Parish community members, overweight and obese adults are more likely to report a number of adverse health conditions.

These include:

- Hypertension (high blood pressure).
- High cholesterol.
- Diabetes.
- “Fair” or “poor” physical health.
- Chronic heart disease.

Note: Reflects responses among the total sample of respondents, segmented by their bodyweight category (categories are mutually exclusive).
Child Overweight

In children and teens, body mass index is used to assess underweight, overweight, and risk for overweight. Children’s body fatness changes over the years as they grow. Also, girls and boys differ in their body fatness as they mature. This is why BMI for children (also referred to as BMI-for-age) is gender and age specific. BMI-for-age is plotted on gender specific growth charts. These charts are used for children and teens 2 – 20 years of age. Healthcare professionals use the following established percentile cutoff points to identify underweight and overweight in children.

- Underweight..............................<5th percentile
- At Risk of Overweight.............85th to 95th percentile
- Overweight................................≥ 95th percentile

– National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention.

A total of 10.1% of Grant Parish children aged 6 to 17 are overweight, based on heights/weights reported by surveyed parents.

- Lower than the 30.6% prevalence reported across the RFSA.
- Similar to the national prevalence for child overweight (14.1%).

**TREND**: Lower than the 32.8% reported in Grant Parish in 2002.

---

**Child Overweight**

(Among Children Ages 6 To 17; By Region; 2002-2005 Trend Data)

- 10.1% Grant Parish '05
- 30.6% RFSA 2005
- 14.1% US 2005
- 32.8% Grant Parish 2002
- 10.1% Grant Parish 2005

Source: • PRC Community Health Surveys, Professional Research Consultants. [Item 166]
• 2005 PRC National Health Survey, Professional Research Consultants.

Note: • Asked of all respondents with children aged 6 to 17 at home.
• Overweight among children is estimated based on children's' Body Mass Index status above the 95th percentile of U.S. growth charts by gender and age.
• State data not available.
PHYSICAL ACTIVITY & FITNESS

The 1990s brought a historic new perspective to exercise, fitness, and physical activity by shifting the focus from intensive vigorous exercise to a broader range of health-enhancing physical activities. Research has demonstrated that virtually all individuals will benefit from regular physical activity. A Surgeon General's report on physical activity and health concluded that moderate physical activity can reduce substantially the risk of developing or dying from heart disease, diabetes, colon cancer, and high blood pressure. Physical activity also may protect against lower back pain and some forms of cancer (for example, breast cancer), but the evidence is not yet conclusive.

On average, physically active people outlive those who are inactive. Regular physical activity also helps to maintain the functional independence of older adults and enhances the quality of life for people of all ages.

The role of physical activity in preventing coronary heart disease (CHD) is of particular importance, given that CHD is the leading cause of death and disability in the United States. Physically inactive people are almost twice as likely to develop CHD as persons who engage in regular physical activity. The risk posed by physical inactivity is almost as high as several well-known CHD risk factors, such as cigarette smoking, high blood pressure, and high blood cholesterol. Physical inactivity, though, is more prevalent than any one of these other risk factors. People with other risk factors for CHD, such as obesity and high blood pressure, may particularly benefit from physical activity.

Work-Related & Leisure-Time Physical Activity

Level Of Activity At Work

Nearly half of employed Grant Parish respondents report low levels of physical activity at work.

- 49.4% of employed respondents report that their job entails mostly sitting or standing.
- Others report that they mostly walk (25.7%) or perform physically demanding work (24.9%).

<td>21.2%</td>
</tr>
</tbody>
</table>

Source: • 2005 PRC Community Health Survey, Professional Research Consultants. [Item 93]

Note: • Asked of all employed respondents.
**Leisure-Time Physical Activity**

To address physical activity during leisure time (outside of regular work duties), respondents were asked: “During the past month, other than your regular job, did you participate in any physical activities or exercises, such as running, calisthenics, golf, gardening, or walking for exercise?”

More than one-third (34.9%) of Grant Parish adults report **no leisure-time physical activity in the past month**.

- Similar to the 34.1% found throughout the RFSA.
- Less favorable than the 29.7 reported across the state and the 25.5% reported across the nation.

**TREND**: Statistically unchanged from the 31.4% reported in 2002.

A lack of leisure-time physical activity is more prevalent among respondents living at very low or low income levels.
Effects Of Physical Inactivity And Unhealthy Diets

- Poor diet and physical inactivity lead to 300,000 deaths each year—second only to tobacco use.
- People who are overweight or obese increase their risk for heart disease, diabetes, high blood pressure, arthritis-related disabilities, and some cancers.
- Not getting an adequate amount of exercise is associated with needing more medication, visiting a physician more often, and being hospitalized more often.

Costs

- The direct medical cost associated with physical inactivity was $29 billion in 1987 and nearly $76.6 billion in 2000.
- The annual cost of obesity in the United States is about $100 billion.

Moderate Physical Activity

In the past month, less than one-fifth (23.1%) of Grant Parish adults regularly participated in moderate physical activity.

- Similar to the 23.5% recorded throughout the RSFA.
- Much less favorable than the U.S. prevalence (31.8%).
- Fails to satisfy the Healthy People 2010 target (30% or higher).

TREND: Statistically unchanged from the 19.9% reported in 2002.
Participate in moderate physical activity does not significantly vary among key demographics.

- **Moderate Physical Activity**

  **(By Region; 2002-2005 Trend Data)**

  Source: • PRC Community Health Surveys, Professional Research Consultants. [Item 138]
  • 2005 PRC National Health Survey, Professional Research Consultants.

  Note: • Asked of all respondents.
  • Takes part in "light/moderate physical activity" (exercise that produces only light sweating or a slight to moderate increase in breathing or heart rate) at least 5 times a week for 30 minutes at a time.
  • The Healthy People 2010 goal is to increase to at least 30% the proportion of people who engage regularly, preferably daily, in moderate physical activity for at least 30 minutes per day.
  • State data not available.

Vigorous Physical Activity

In the past month, 27.5% of Grant Parish adults regularly participated in vigorous physical activity (causing heavy sweating or large increases in breathing or heart rate).

- Similar to the 28.1% reported across the RFSA.
- Much less favorable than the U.S. prevalence (33.9%).
- Close to the Healthy People 2010 objective (30% or higher).

**TREND:** Statistically unchanged from the 31.3% reported in 2002.

Note the following demographic breakout for regular participation in vigorous physical activity.
Strengthening Activity

In the past month, 20.7% of Grant Parish adults regularly participated in strengthening activities at least twice weekly (activities designed to strengthen muscles, such as lifting weights or doing calisthenics).

- Lower than the 25.3% reported throughout the RFSA.
- Fails to satisfy the Healthy People 2010 target (30% or higher).

**TREND:** Marks a statistically significant decrease in strengthening activity since 2002.

No Grant Parish segment currently meet the related Healthy People 2010 objective when analyzed by key demographics.

Source: • PRC Community Health Surveys, Professional Research Consultants. [Item 97]

Note: • Asked of all respondents.
• Takes part in “strengthening activity” (activities that are specifically designed to strengthen muscles, such as lifting weights or doing calisthenics) at least twice weekly.
• The Healthy People 2010 goal is to increase to at least 30% the proportion of people who perform physical activities which enhance and maintain muscular strength and endurance.
• State and national data not available.

**Child Watches Three Or More Hours Of Television On A Typical School Day**

(By Region; 2002-2005 Trend Data)

- **Source:** PRC Community Health Surveys, Professional Research Consultants. [Item 132]
- **Note:** Asked of all respondents with children aged 5 to 17 at home.
- State and national data not available.
Substance abuse and its related problems are among society’s most pervasive health and social concerns. Each year, about 100,000 deaths in the United States are related to alcohol consumption. Illicit drug abuse and related acquired immunodeficiency syndrome (AIDS) deaths account for at least another 12,000 deaths. In 1995, the economic cost of alcohol and drug abuse was $276 billion. This represents more than $1,000 for every man, woman, and child in the United States to cover the costs of healthcare, motor vehicle crashes, crime, lost productivity, and other adverse outcomes of alcohol and drug abuse.

A substantial proportion of the population drinks alcohol… Alcohol use and alcohol-related problems also are common among adolescents. Excessive drinking has consequences for virtually every part of the body. The wide range of alcohol-induced disorders is due (among other factors) to differences in the amount, duration, and patterns of alcohol consumption, as well as differences in genetic vulnerability to particular alcohol-related consequences… Alcohol use has been linked with a substantial proportion of injuries and deaths from motor vehicle crashes, falls, fires, and drownings. It also is a factor in homicide, suicide, marital violence, and child abuse and has been associated with high-risk sexual behavior…

Illegal use of drugs, such as heroin, marijuana, cocaine, and methamphetamine, is associated with other serious consequences, including injury, illness, disability, and death, as well as crime, domestic violence, and lost workplace productivity. Drug users and persons with whom they have sexual contact run high risks of contracting gonorrhea, syphilis, hepatitis, tuberculosis, and human immunodeficiency virus (HIV). The relationship between injection drug use and HIV/AIDS transmission is well known. Injection drug use also is associated with hepatitis B and C infections… Long-term consequences, such as chronic depression, sexual dysfunction, and psychosis, may result from drug use.

Although there has been a long-term drop in overall use, many people in the United States still use illicit drugs… Drug use among adolescents aged 12 to 17 years doubled between 1992 and 1997… Drug and alcohol use by youth also is associated with other forms of unhealthy and unproductive behavior, including delinquency and high-risk sexual activity.

The stigma attached to substance abuse increases the severity of the problem. The hiding of substance abuse, for example, can prevent persons from seeking and continuing treatment and from having a productive attitude toward treatment. Compounding the problem is the gap between the number of available treatment slots and the number of persons seeking treatment for illicit drug use or problem alcohol use.

**Age-Adjusted Cirrhosis Deaths**

*Between 2000 and 2002, there was an annual average age-adjusted cirrhosis/liver disease death rate of 5.2 deaths per 100,000 population in Grant Parish.*

- Lower than the 9.4 per 100,000 RFSA rate.
- Lower than the the 8.2 statewide rate and the 9.5 national rate.
- Fails to satisfy the Healthy People 2010 objective of 3.0 or lower.
- In Grant Parish, the cirrhosis/liver disease death rate is much higher among Blacks/African Americans (33.6) than among Whites (1.7).
**TREND:** Age-adjusted cirrhosis/liver disease mortality rates in Grant Parish declined in recent years. Rates remained fairly stable across the U.S. during this timeframe.

**Alcohol Use**

**Current Drinkers**

Current drinkers include survey respondents reporting one or more drinks of alcohol in the month preceding the interview. For the purposes of this study, a “drink” is defined as one can or bottle of beer, one glass of wine, one can or bottle of wine cooler, one cocktail or one shot of liquor.

**In Grant Parish, 38.9% of adults are current drinkers.**

- More favorable than the 58.0% reported across the United States.
- Less favorable than 2002 findings (25.7%).

**High-Risk Alcohol Use**

**Chronic Drinking**

Chronic drinkers include respondents reporting 60 or more drinks of alcohol in the month preceding the interview (an average of two or more per day).

**5.9% of Grant Parish adults report an average of two or more drinks of alcohol per day in the past month.**

- Similar to the percentage recorded throughout the RFSA (5.1%).
- Similar to the 5.3% reported nationwide.

**TREND:** Statistically higher than the 2.4% reported in 2002.

---

**Chronic Drinkers**

(By Region; 2002-2005 Trend Data)

![Chronic Drinkers Chart](chart)

Source:
- PRC Community Health Surveys, Professional Research Consultants. [Item 144]
- 2005 PRC National Health Survey, Professional Research Consultants.

Note:
- Reflects the total sample of respondents.
- Chronic drinkers are defined as those who have had at least 60 drinks of alcoholic beverages during the past month.
- State data not available.
Chronic drinking is more prevalent in Grant Parish among:

- Men (especially men aged 18 through 39).
- Adults under the age of 65.

### Binge Drinking

Binge drinkers are respondents who report that there was one or more times in the past month when they drank five or more drinks on a single occasion.

**11.4% of Grant Parish adults are binge drinkers.**

- More favorable than the 16.3% reported across the U.S.
- Fails to satisfy the Healthy People 2010 target (6% or lower).

**TREND:** Statistically unchanged from the 8.5% reported in 2002.
Note that binge drinking is more prevalent among:

- Men (particularly men aged 18 to 39).
- Individuals at the low income level.

Only women and adults aged 65 and older currently satisfy the Healthy People 2010 target.

Illicit Drug Use

For the purposes of this survey, “illicit drug use” includes use of illegal substances or of prescription drugs taken without a physician’s order.

A total of 2.1% of parish adults acknowledge using an illicit drug in the past month.

- Similar to the 1.9% reported across the RFSA.
- Similar to the 2.5% found nationwide.
- Close to the Healthy People 2010 target (2% or lower).

• In this case, the term “illicit drug use” includes use of an illegal drug and/or use of a prescription drug without a physician’s orders.
• State data not available.

Alcohol & Drug Treatment

Among parish respondents, 4.0% have sought professional help for an alcohol- or drug-related problem.

- Similar to the 3.7% reported throughout the RFSA and the 3.3% nationwide.

**TREND**: Statistically unchanged from the 2.8% reported in 2002.

Note: • Asked of all respondents.
• State data not available.
Tobacco Use

Cigarette smoking causes heart disease, several kinds of cancer (lung, larynx, esophagus, pharynx, mouth, and bladder), and chronic lung disease. Cigarette smoking also contributes to cancer of the pancreas, kidney, and cervix. Smoking during pregnancy causes spontaneous abortions, low birth weight, and sudden infant death syndrome. Other forms of tobacco are not safe alternatives to smoking cigarettes.

Tobacco use is responsible for more than 430,000 deaths per year among adults in the United States [about 20% of all deaths]… If current tobacco use patterns persist in the United States, an estimated 5 million persons under age 18 years will die prematurely from a smoking-related disease. Direct medical costs related to smoking total at least $50 billion per year [other sources estimate more than $75 billion in 1998, about 8% of the personal healthcare expenditures in the U.S.]; direct medical costs related to smoking during pregnancy are approximately $1.4 billion per year.

Evidence is accumulating that shows maternal tobacco use is associated with mental retardation and birth defects such as oral clefts. Exposure to secondhand smoke also has serious health effects. Researchers have identified more than 4,000 chemicals in tobacco smoke; of these, at least 43 cause cancer in humans and animals. Each year, because of exposure to secondhand smoke, an estimated 3,000 nonsmokers die of lung cancer, and 150,000 to 300,000 infants and children under age 18 months experience lower respiratory tract infections.

(For lung cancer prevalence, see “Cancer;” for prevalence of other lung diseases, see “Respiratory Disease.”)

Cigarette Smoking

Cigarette Smoking Prevalence

One out of three parish adults (34.5%) currently smokes cigarettes, either regularly (every day) or occasionally (on some days).

- Another one-fourth (23.7%) of Grant Parish adults are former smokers (those who have smoked 100 or more cigarettes in their lives, but do not currently smoke).
- Less than one-half (41.8%) have never smoked.

Cigarette Smoking Prevalence

(Grant Parish, 2005)

Occasional Smoker 9.4%
Regular Smoker 25.1%
Former Smoker 23.7%
Never Smoked 41.8%

Source: • 2005 PRC Community Health Survey, Professional Research Consultants. [Item 140]
Note: • Asked of all respondents.
Current smoking prevalence in Grant Parish (34.5%) is:

- Higher than the prevalence across the RFSA (24.9%).
- Higher than that recorded in Louisiana (23.5%) and across the U.S. (22.2%).
- Much higher than the Healthy People 2010 target of 12% or lower.

**TREND**: Current smoking levels in Grant Parish are *significantly higher* than the 22.1% reported in 2002.

The following chart looks at current smoking prevalence by various demographic characteristics. As shown, cigarette smoking is more prevalent among:

- Adults under the age of 65.
- Persons living at low or very low incomes.

Of the groups outlined, none currently satisfy the Healthy People 2010 objective.

Note also that 38.0% of women of child-bearing age (ages 18 to 44) currently smoke. This is notable given that tobacco use increases the risk of infertility, as well as the risks for miscarriage, stillbirth and low birthweight for women who smoke during pregnancy.
Smoking Cessation

Health Advice About Smoking Cessation

Among parish smokers, nearly two-thirds (63.6%) report that a doctor, nurse or other health professional has recommended in the past year that they quit smoking.

- Similar to the 61.0% found throughout the RFSA.
- Similar to the 66.2% reported nationwide.

Smoking Cessation Attempts

Less than one-half (44.1%) of Grant Parish everyday smokers went without smoking for one day or longer in the past year because they were trying to quit smoking.

- Statistically similar to 50.9% reported across the RFSA.
- Less favorable than the 57.9% reported nationwide.
- Fails to satisfy the Healthy People 2010 target (75% or higher).

**TREND:** Significantly lower than the 62.2% reported in 2002.
Environmental Tobacco Smoke

Nearly out of four Grant Parish adults (24.6%) report that a member of their household has smoked cigarettes in the home in the past month an average of four or more times per week.

- Higher than the 19.0% prevalence reported across the nation.

Note that 12.3% of Grant Parish non-smokers are exposed to cigarette smoke at home.

Member Of Household Smokes At Home

(By Region, 2005)

Note: 12.3% of Grant Parish non-smokers are exposed to smoke at home.

Note: Reflects respondents with children aged 0 to 17 years old.

- *Smokes at home* refers to someone smoking cigarettes, cigars or a pipe in the home an average of four or more times per week in the past month.
- State data not available.
Other Tobacco Use

A total of 10.6% of Grant Parish adults currently use smokeless tobacco (e.g., chewing tobacco or snuff) every day or on some days.

- Similar the 8.4% reported across the RFSA.
- Worse than the 4.5% reported across the U.S.
- Fails to satisfy the Healthy People 2010 target (2% or lower).

**TREND:** Statistically similar to the 8.2% reported in 2002.

---

**Use Of Smokeless Tobacco**

(By Region; 2002-2005 Trend Data)

- Grant Parish 2005: 10.6%
- RFSA 2005: 8.4%
- US 2005: 4.5%

- 2005 PRC National Health Survey, Professional Research Consultants.

Note:
- Asked of all respondents.
- Includes respondents who use chewing tobacco/snuff every day or on some days.
- State data not available.
The initial inquiry of the 2005 PRC Community Health Survey asked respondents the following: “Would you say that in general your health is: excellent, very good, good, fair or poor?”

A total of 45.4% of survey respondents rate their overall health as “excellent” or “very good.”

However, nearly one-fourth (22.6%) believe that their overall health is rate it as “fair” or “poor.”

- Statistically comparable to the 22.6% reported throughout the RFSA and the 18.6% reported nationwide by PRC this year.

**TREND:** Also note that the 2005 proportion of community members reporting “fair/poor” overall health is similar to that reported in 2002 (25.5%).
The following chart further examines self-reported health status by various demographic characteristics.

- As might be expected, indications of “fair” or “poor” health increase with age; that is, older residents much more often report their health as “fair” or “poor.”
- There is a very strong negative correlation with income — persons living at very low income levels, as well as those living at low incomes (a.k.a. the “working poor”) give much higher indications of “fair/poor” health.

Days Of Poor Physical/Mental Health

While a majority of Grant Parish adults report no days in which poor physical or mental health prevented their usual activities in the past month, 16.8% report experiencing four or more days in the past month when poor physical or mental health prevented their usual activities.

- This prevalence is comparable to the 16.4% reported throughout the RFSA.
- Adults aged 40 through older are more likely than younger adults to mention that poor physical health prevented their usual activities last month.
- Also, adults living at lower incomes are much more likely than those in the highest income bracket to report that poor physical or mental health prevented their usual activities in the past month.
- More than one in five (27.7%) Black/African American adults reported four or more days, compared to 14.2% among Whites.

MENTAL HEALTH & MENTAL DISORDERS

*Mental health* is a state of successful performance of mental function, resulting in productive activities, fulfilling relationships with other people, and the ability to adapt to change and to cope with adversity. Mental health is indispensable to personal well-being, family and interpersonal relationships, and contribution to community or society. *Mental disorders* are health conditions that are characterized by alterations in thinking, mood, or behavior (or some combination thereof), which are associated with distress and/or impaired functioning and spawn a host of human problems that may include disability, pain, or death. Mental illness is the term that refers collectively to all diagnosable mental disorders…

Mental disorders generate an immense public health burden of disability. The World Health Organization, in collaboration with the World Bank and Harvard University, has determined … that the impact of mental illness on overall health and productivity in the United States and throughout the world often is profoundly underrecognized [Global Burden of Disease study]. In established market economies such as the United States, mental illness is on a par with heart disease and cancer as a cause of disability. Suicide—a major public health problem in the U.S.—occurs most frequently as a consequence of a mental disorder.

- Mental disorders occur across the lifespan, affecting persons of all racial and ethnic groups, both genders, and all educational and socioeconomic groups…
- Modern treatments for mental disorders are highly effective, with a variety of treatment options available for most disorders…[however], the majority of persons with mental disorders do not receive mental health services.
- The co-occurrence of addictive disorders among persons with mental disorders is gaining increasing attention from mental health professionals…Having both mental and addictive disorders…is a particularly significant clinical treatment issue, complicating treatment for each disorder…
- There is increasing awareness and concern in the public health sector regarding the impact of stress, its prevention and treatment, and the need for enhanced coping skills…
- Evidence that mental disorders are legitimate and highly responsive to appropriate treatment promises to be a potent antidote to stigma. Stigma creates barriers to providing and receiving competent and effective mental health treatment and can lead to inappropriate treatment, unemployment, and homelessness.
- In later life, the majority of people aged 65 years and older cope constructively with the changes associated with aging and maintain mental health, yet an estimated 25% of older people experience specific mental disorders, such as depression, anxiety, substance abuse, and dementia, that are not part of normal aging. Alzheimer’s disease strikes 8% to 15% of people over age 65 years, with the number of cases in the population doubling every 5 years of age after age 60 years. Alzheimer’s disease is thought to be responsible for 60% to 70% of all cases of dementia and is one of the leading causes of nursing home placements.

As the life expectancy of individuals continues to grow longer, the sheer number—although not necessarily the proportion—of persons experiencing mental disorders of late life will expand. This trend will present society with unprecedented challenges in organizing, financing, and delivering effective preventive and treatment services for mental health.

---

Between 2000 and 2002, there was an annual average age-adjusted Alzheimer’s disease death rate of 28.3 deaths per 100,000 population in Grant Parish.

- The Grant Parish rate is higher than regional (24.5) as well as state (24.3) and national (19.2) rates.

**TREND:** Between 1999 and 2002, the reported Grant Parish age-adjusted mortality rate due to Alzheimer’s disease increased from 13.5 to 28.3 (this increase may be related to improvement in reporting of the disease). This increase was more pronounced in Grant Parish and the RFSA when compared with state and national numbers.
Self-Reported Mental Health Status

When asked to evaluate their own mental health status, more than 6 in 10 (64.1%) Grant Parish respondents said “excellent” or “very good.” In contrast, 16.1% rated it as “fair” or “poor.”

- Statistically similar to findings throughout the RFSA (13.8% “fair/poor”).
- Less favorable than national findings (11.7).
- The proportions of Grant Parish adults reporting “fair/poor” mental health are highest among adults living at the very low income level (41.9%) and Black/African Americans (27.0%).

Source: • 2005 PRC Community Health Survey, Professional Research Consultants. [Item 102]
Note: • Asked of all respondents.
• In this case, the term “mental health” refers to stress, depression, and problems with emotions.
Days Of Feeling Sad, Blue, Or Depressed

Grant Parish adults average 3.3 days per month when they were sad, blue, or depressed.

- Comparable to the 3.5 days reported among respondents throughout the RFSA.

**TREND:** The 2005 average is statistically unchanged from the 3.0 days reported in 2002.

- Highest among women, adults under aged 40 to 64, those in the lower income breakouts, and Blacks/African Americans.

**Average Number Of Days Felt Sad, Blue, Or Depressed In Past Month**

(By Region; 2002-2005 Trend Data)

Source: • PRC Community Health Surveys, Professional Research Consultants. [Item 104]
Note: • Asked of all respondents.
• State and national data not available.

**Average Number Of Days Felt Sad, Blue, Or Depressed In Past Month**

Source: • 2005 PRC Community Health Survey, Professional Research Consultants. [Item 104]
Note: • Asked of all respondents.
• Income categories reflect respondent's household income as a ratio to the federal poverty level for their household size:
  *very low income* = below poverty; *low income* = 100% to 200% of poverty; *middle/high income* = over 200% of poverty.
Depression is a serious illness affecting many in the population, whether occasionally or, in many cases, for prolonged periods of time.

**Experience Chronic Depression**

Nearly one in three Grant Parish adults (29.1%) reports that they have had two or more years in their lives when they felt depressed or sad on most days, although they may have felt okay sometimes.

- Similar to the 32.1% reported across the RFSA.
- Similar to the 24.9% reported nationwide.
- This represents roughly 4,450 adults across the parish who have faced or are facing prolonged bouts with depression.

**TREND:** Statistically unchanged from the 27.2% reported in 2002.

The following chart illustrates differences found among key demographic groups. Note that self-reported prevalence of chronic depression is considerably higher among:

- Women.
- Adults 40 or older.
- Persons living at low or very low income levels.
Mental Health Treatment

Among Grant Parish adults reporting chronic depression, 38.4% acknowledge that they have sought professional help for a mental or emotional problem at some point in their lives.

- Nearly identical to the prevalence reported across the parish in 2002 (39.4%).
- Fails to satisfy the Healthy People 2010 Objective (50% or more of those experiencing depression will seek professional help).

Have Sought Professional Help For A Mental Or Emotional Problem
(Among Respondents With Recognized Depression; Grant Parish, 2005)

### Children & Attention-Deficit/Hyperactivity Disorder

One out of 20 parents in Grant Parish (4.4%) reports that their school-aged child takes medication for attention-deficit disorder or attention-deficit/hyperactivity disorder (ADD/ADHD).

- Similar throughout the RFSA overall.
- Similar to the nationwide percentage (4.2%).
- Similar among gender (due to small sample sizes differences may appear notable but they are not statistically significant).

### Child Takes Medication For ADD/ADHD

(By Region And Gender, 2005; Among Parents Of Children Age 5 To 17)

MATERNAL, INFANT & CHILD HEALTH

The health of mothers, infants, and children is of critical importance, both as a reflection of the current health status of a large segment of the U.S. population and as a predictor of the health of the next generation… Infant mortality is an important measure of a nation’s health and a worldwide indicator of health status and social well-being. As of 1995, the U.S. infant mortality rates ranked 25th among industrialized nations. In the past decade, critical measures of increased risk of infant death, such as new cases of low birth weight (LBW) and very low birth weight (VLBW), actually have increased in the United States. In addition, the disparity in infant mortality rates between whites and specific racial and ethnic groups (especially African Americans, American Indians or Alaska Natives, Native Hawaiians, and Puerto Ricans) persists. Although the overall infant mortality rate has reached record low levels, the rate for African Americans remains twice that of whites.

LBW is associated with long-term disabilities, such as cerebral palsy, autism, mental retardation, vision and hearing impairments, and other developmental disabilities… The general category of LBW infants includes both those born too early (preterm infants) and those who are born at full term but who are too small, a condition known as intrauterine growth retardation (IUGR). Maternal characteristics that are risk factors associated with IUGR include maternal LBW, prior LBW birth history, low prepregnancy weight, cigarette smoking, multiple births, and low pregnancy weight gain. Cigarette smoking is the greatest known risk factor.

African American and Hispanic women also are less likely than whites to enter prenatal care early. For both African American and white women, the proportion entering prenatal care in the first trimester rises with maternal age until the late thirties, then begins to decline… Women in certain racial and ethnic groups also are less likely than white women to breastfeed their infants.

Between 2000-2002, the annual average Grant Parish birth rate was 13.6 births per 100,000 population.

- Lower than the RFSA rate (15.2).
- Lower than the Louisiana rate (14.7).
- Just below the U.S. rate (14.1).

**TREND:** Between 1993 and 2002, Grant Parish birth rate decreased slightly, mirroring the nationwide rate.

Adequacy Of Prenatal Care

Early and continuous prenatal care is the best assurance of infant health. The related Healthy People 2010 objective strives for 90% of pregnant women to receive early and adequate prenatal care.

Between 2000-2002, 82.7% of Grant Parish women giving birth received at least adequate prenatal care during their pregnancy.

- Higher than the 79.2% found across the RFSA.
- Nationwide, 76.1% of mothers had received adequate prenatal care.
  - Note that national data shown below uses a slightly different index to measure adequacy of prenatal care.
- Fails to meet the Healthy People 2010 objective (90% or better).

**TREND:** The percentage of mothers receiving adequate prenatal care has improved steadily over the past decade.

**Note:**
- Numbers are a percentage of all live births within each population.
- For Louisiana data, "adequate prenatal care" is measured by a modified Kessner Index, which defines prenatal care as adequate if the first prenatal visit occurred in the first trimester of pregnancy and if the total number of visits was appropriate to the gestational age of the baby at birth.
- For U.S. data, the Adequacy of Prenatal Care Utilization (APNCU) index is used. Both indices agree in their definition of "adequate" up to 36 weeks gestation; for pregnancies going past 36 weeks gestation, the APNCU requires an additional visit per week whereas the Kessner Index does not.
Birth Outcomes

Low-Weight Births

Low birthweight babies, those who weigh less than 2,500 grams (5 pounds, 8 ounces) at birth, are much more prone to illness and neonatal death than are babies of normal birthweight. Largely a result of receiving poor or inadequate prenatal care, many low-weight births and the consequent health problems are preventable.

8.6% of Grant Parish births between 2000-2002 were of low birthweight.

- More favorable than regional and statewide rates.
- Less favorable than the 7.7% reported nationwide.
- Fails to satisfy the Healthy People 2010 target (5% or lower).

- Numbers are a percentage of all live births within each population.
**TREND:** The percentage of low-weight births across the parish has remained stable in recent years. The percentage has increased somewhat regionally, statewide and nationwide.

### Infant Mortality

Infant mortality rates reflect deaths of children less than one year old per 1,000 live births.

**Between 2000 and 2002, there was an annual average of 11.9 infant deaths per 1,000 live births in Grant Parish.**

- Higher than the rates reported throughout the RFSA and in Louisiana (each 9.6).
- Much higher than the 6.9 mortality rate recorded across the nation.
- Fails to satisfy the Healthy People 2010 target (4.5 or fewer per 1,000 live births).

### Infant Mortality Rates

**(By Region; Average Annual Infant Deaths Per 1,000 Live Births; 2000-2002)**

- **Grant Parish:** 11.9
- **RFSA:** 9.6
- **Louisiana:** 9.6
- **United States:** 6.9

**Source:**
- Louisiana Department of Health and Hospitals.

**Note:**
- Rates are three-year averages of deaths of children under 1 year old per 1,000 live births.
The Black/African American population in Grant Parish experiences a notably higher infant mortality rate (1993-2002) compared to other races.

**TREND:** Over the past several years, infant mortality has increased in Grant Parish, in contrast to the decreasing trend found nationwide.

Neonatal Mortality

Neonatal mortality rates reflect deaths of children within the first 28 days of life per 1,000 live births.

Between 2000 and 2002, the parish experienced an annual average of 9.2 neonatal deaths per 1,000 live births.

- Higher than the 6.7 reported throughout the RFSA and the 6.2 reported statewide.
- Twice the U.S. rate (4.6).
- Fails to satisfy the Healthy People target (2.9 deaths or lower).

FAMILY PLANNING

In an era when technology should enable couples to have considerable control over their fertility, half of all pregnancies in the United States are unintended. Although between 1987 and 1994 the proportion of pregnancies that were unintended declined in the United States from 57 to 49 percent, other industrialized nations report fewer unintended pregnancies, suggesting that the number of unintended pregnancies can be reduced further. Family planning remains a keystone in attaining a national goal aimed at achieving planned, wanted pregnancies and preventing unintended pregnancies.

Socially, the costs can be measured in unintended births, reduced educational attainment and employment opportunity, greater welfare dependency, and increased potential for child abuse and neglect. Economically, healthcare costs are increased… The consequences of unintended pregnancy are not confined to those occurring in teenagers or unmarried couples. In fact, unintended pregnancy can carry serious consequences at all ages and life stages.

With an unintended pregnancy, the mother is less likely to seek prenatal care in the first trimester and more likely not to obtain prenatal care at all. She is less likely to breastfeed and more likely to expose the fetus to harmful substances, such as tobacco or alcohol. The child of such a pregnancy is at greater risk of low birth weight, dying in its first year, being abused, and not receiving sufficient resources for healthy development. A disproportionate share of the women bearing children whose conception was unintended are unmarried or at either end of the reproductive age span—factors that, in themselves, carry increased medical and social burdens for children and their parents. Pregnancy begun without some degree of planning often prevents individual women and men from participating in preconception risk identification and management.

Unintended pregnancies occur among females of all socioeconomic levels and all marital status and age groups, but females under age 20 years and poor and African American women are especially likely to become pregnant unintentionally. More than 4 in 10 pregnancies to white and Hispanic females [nationwide] are unintended; 7 in 10 pregnancies to African American females [nationwide] are unintended. Poverty is strongly related to greater difficulty in using reversible contraceptive methods successfully, with these females also the least likely to have the resources necessary to access family planning services and the most likely to be affected negatively by an unintended pregnancy.

Births To Unwed Mothers

According to the Centers for Disease Control and Prevention (CDC), an unintended pregnancy is a pregnancy that is either mistimed or unwanted at the time of conception. It is a core concept in understanding the fertility of populations and the unmet need for contraception. Unintended pregnancy is associated with an increased risk of morbidity for women, and with health behaviors during pregnancy that are associated with adverse effects. For example, women with an unintended pregnancy may delay prenatal care, which may affect the health of the infant. Women of all ages may have unintended pregnancies, but some groups, such as teens, are at a higher risk.

Because it is impossible to measure the true incidence of unintended pregnancy in the U.S., the following indicator looks at births occurring among unmarried mothers as a proxy measure for pregnancies that are not intended (knowing that this is not always the case).
More than one-third (34.1%) of women giving birth in Grant Parish between 2000 and 2002 were unmarried.

- Lower than the 41.1% RFSA rate and the 46.3% found across Louisiana.
- Similar to the 33.6% reported nationwide.

**TREND**: In recent years, the percentage of births to unwed mothers remained stable within each of the regions shown.
For teenagers, the problems associated with unintended pregnancy are compounded, and the consequences are well documented. Teenaged mothers are less likely to get or stay married, less likely to complete high school or college, and more likely to require public assistance and to live in poverty than their peers who are not mothers. Infants born to teenaged mothers, especially mothers under age 15 years, are more likely to suffer from low birth weight, neonatal death, and sudden infant death syndrome. The infants may be at greater risk of child abuse, neglect, and behavioral and educational problems at later stages. Nearly 1 million teenage pregnancies occur each year in the United States.

**Between 2000-2002, 17.4% of Grant Parish births were to mothers between the ages of 10 and 19 years-old.**

- Comparable to the 18.2% reported throughout the RFSA.
- Less favorable than the 16.3% reported across the State of Louisiana.
- Much less favorable than the 11.3% reported across the United States.

Note: • Numbers are a percentage of all live births within each population.
INFECTIOUS DISEASES

IMMUNIZATION

Infectious diseases remain major causes of illness, disability, and death. Moreover, new infectious agents and diseases are being detected, and some diseases considered under control have reemerged in recent years. In addition, antimicrobial resistance is evolving rapidly in a variety of hospital- and community-acquired infections. These trends suggest that many challenges still exist in the prevention and control of infectious diseases.

Vaccine-Preventable Diseases

Between 2001-2003, there were no reported cases of measles, mumps, rubella or pertussis in Grant Parish.

- The Healthy People 2010 goal for measles, mumps, and rubella is 0 cases.

  - Louisiana Department of Health and Hospitals.

  **Note:** Rates are per 100,000 population.

**Pertussis**

- **TREND:** Grant Parish had no cases of pertussis (a.k.a. “whooping cough”) reported between 1993 and 2003. In contrast, the pertussis incidence appears to be on the increase nationally.

- **Pertussis Incidence**

  ![Graph showing disease rates](image)

  **Source:**
  - Louisiana Department of Health and Hospitals.

  **Notes:** Rates are per 100,000 population.
**Acute Hepatitis C**

Between 2001 and 2003, there was an annual average of 1.8 acute hepatitis C cases per 100,000 population reported in Grant Parish.

- Slightly higher than the 1.1 incidence rate reported across the RFSA.
- Lower than the 2.6 found statewide.
- Higher than the national incidence rate (0.5).

**TREND:** Hepatitis C incidence increased in Grant Parish between 2000 and 2003, while state and national rates declined.
Influenza/Pneumonia Vaccination

Influenza

Nearly 3 out of 4 Grant Parish adults aged 65 and older (74.1%) received a flu shot within the past year.

- Statistically similar to each of the four demographic regions.
- Fails to satisfy the Healthy People 2010 target (90% or higher).

**TREND:** The 2005 finding is comparable to that reported in 2002 among older adults in Grant Parish.

High-Risk Adults Aged 18 To 64

In this instance, “high-risk” includes adults aged 18 to 64 who report having been diagnosed with heart disease, diabetes or respiratory disease.

In Grant Parish, 27.1% of high-risk adults aged 18 to 64 received a flu shot within the past year.

- Statistically similar to the 26.8% reported throughout the RFSA.
- Statistically similar to the 22.4% found nationwide.
- Fails to satisfy the Healthy People 2010 target (60% or higher).
Pneumonia

A majority (80.2%) of Grant Parish adults aged 65 and older have received a pneumonia vaccination at some point in their lives.

- Similar to the 79.3% found throughout the RFSA.
- More favorable that the proportion found statewide (67.3%).
- Similar to the 74.2% reported across the United States.
- Fails to satisfy the Healthy People 2010 target (90% or higher).

**TREND:** Statistically similar to the 76.7% reported in 2002.

Note:
- "High-Risk" includes adults aged 18 to 64 who have been diagnosed with heart disease, diabetes or respiratory disease.
- State data not available.
Tuberculosis is an infectious disease caused by a type of bacteria called *Mycobacterium tuberculosis*. TB is spread from person to person through the air, as someone with active tuberculosis of the respiratory tract coughs, sneezes, yells, or otherwise expels bacteria-laden droplets.

The Institute of Medicine (IOM), an arm of the National Academy of Sciences, released a report in May 2000 that lays out an action plan for eliminating tuberculosis in the United States ... As a key part of the plan, new TB treatment and prevention strategies must be developed that are tailored to the current environment. Among today's hallmarks:

- Tuberculosis now occurs in ever-smaller numbers in most regions of the country.
- Foreign-born people (both legal and undocumented immigrants) coming to the United States from countries with high rates of TB now account for nearly half of all TB cases.
- Higher numbers of cases are concentrated in pockets located in major metropolitan areas, and this increased prevalence is due, in large part, to the increased number of people with or at risk for HIV/AIDS infection.
- Other groups, such as HIV-infected people and the growing population of prison inmates, the homeless, and intravenous drug abusers, are emerging as being at high risk.

Between 2001-2003, there was an annual average of 3.4 reported cases of tuberculosis per 100,000 population in Grant Parish.

- Less favorable than the RFSA rate (2.4).
- More favorable than the 6.2 reported statewide.
- More favorable than the 5.4 reported nationally.

</table>

**TREND:** Since 2000, the Grant Parish incidence rate has declined steadily overall, similar to regional, state and national trends.
Shigellosis

Between 2001-2003, there was an annual average of 21.2 reported cases of shigellosis per 100,000 population in Grant Parish.

- Much higher than the rate reported across the RFSA.
- Much higher than state and national rates.

**TREND:** The 2001-2003 reporting period included a very high incidence of shigellosis cases in Grant Parish, compared to the 2000-2002 reporting period.
Salmonellosis

Between 2001-2003, there was an annual average of 16.0 reported cases of salmonellosis per 100,000 population in Grant Parish.

- Less favorable than the 15.1 rate reported both for the RFSA and nationally.
- More favorable than the 18.7 reported statewide.

**TREND:** The Grant Parish 2001-2003 reporting period had a notably higher salmonellosis incidence rate compared to the 2000-2002 reporting period. The increase across the RFSA was less dramatic.
Between 2001-2003, the annual average campylobacteriosis incidence rate in Grant Parish was 1.8 per 100,000 population.

- Lower than the state and RFSA incidence rates (each 2.8).

**TREND:** The Grant Parish 2001-2003 reporting period had an identical incidence rate compared to the 2000-2002 reporting period.
HIV/AIDS

In the United States, HIV/AIDS remains a significant cause of illness, disability, and death, despite declines in 1996 and 1997.

Behaviors (sexual practices, substance abuse, and accessing prenatal care) and biomedical status (having other STDs) are major determinants of HIV transmission. Unprotected sexual contact, whether homosexual or heterosexual, with a person infected with HIV and sharing drug-injection equipment with an HIV-infected individual account for most HIV transmission in the United States. Increasing the number of people who know their HIV serostatus is an important component of a national program to slow or halt the transmission of HIV in the United States.

For persons infected with HIV, behavioral determinants also play an important role in health maintenance. Although drugs are available specifically to prevent and treat a number of opportunistic infections, HIV-infected individuals also need to make lifestyle-related behavioral changes to avoid many of these infections. The new HIV antiretroviral drug therapies for HIV infection bring with them difficulties in adhering to complex, expensive, and demanding medication schedules, posing a significant challenge for many persons infected with HIV.

Because HIV infection weakens the immune system, people with tuberculosis (TB) infection and HIV infection are at very high risk of developing active TB disease.

Comparing the 1980s to the 1990s, the proportion of AIDS cases in white men who have sex with men declined, whereas the proportion in females and males in other racial and ethnic populations increased, particularly among Black Americans and Hispanics. AIDS cases also appeared to be increasing among injection drug users and their sexual partners. The true extent of the epidemic remains difficult to assess for several reasons, including the following:

- Because of the long period of time from initial HIV infection to AIDS and because highly active antiretroviral therapy (HAART) has slowed the progression to AIDS, new cases of AIDS no longer provide accurate information about the current HIV epidemic in the United States.
- Because of a lack of awareness of HIV serostatus as well as delays in accessing counseling, testing, and care services by individuals who may be infected or are at risk of infection, some populations do not perceive themselves to be at risk. As a result, some HIV-infected persons are not identified and provided care until late in the course of their infection.

---

**Age-Adjusted Mortality**

Between 2000 and 2002, there was an annual average age-adjusted HIV/AIDS death rate of 1.9 deaths per 100,000 population in Grant Parish.

- Lower than the corresponding RFSA age-adjusted death rate (5.7 per 100,000 population).
- Much lower than the statewide rate (8.9) and national rate (5.0).
- Note that Whites did not experience any HIV/AIDS deaths during 2000 to 2002.

---

TREND: While still much lower than the rates seen in the mid-1990s, the Grant Parish age-adjusted HIV/AIDS mortality has increased slightly since 1998.

Source: • CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted July 2005.
Note: • Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
• Rates are per 100,000 population, age-adjusted to the 2000 U.S. Standard Population.
• Parish, state and national data are simple three-year averages, the RFSA three-year averages are weighted by population.
HIV/AIDS Incidence

Between 2001-2003, the annual average Grant Parish rate of new HIV/AIDS cases was 30.1 per 100,000 population.

- Higher than the overall RFSA rate for this period (18.2 per 100,000 population).
- Higher than the statewide rate (25.3).

**TREND:** Between the 1998-2000 and 2001-2003 reporting periods, the Grant Parish HIV/AIDS incidence increased considerably.
SEXUALLY TRANSMITTED DISEASES

Sexually transmitted diseases (STDs) refer to the more than 25 infectious organisms transmitted primarily through sexual activity. STDs are among many related factors that affect the broad continuum of reproductive health agreed on in 1994 by 180 governments at the International Conference on Population and Development (ICPD). At ICPD, all governments were challenged to strengthen their STD programs. STD prevention as an essential primary care strategy is integral to improving reproductive health.

Despite the burdens, costs, complications, and preventable nature of STDs, they remain a significant public health problem, largely unrecognized by the public, policymakers, and public health and healthcare professionals in the United States. STDs cause many harmful, often irreversible, and costly clinical complications, such as reproductive health problems, fetal and perinatal health problems, and cancer. In addition, studies of the worldwide human immunodeficiency virus (HIV) pandemic link other STDs to a causal chain of events in the sexual transmission of HIV infection.

**Gonorrhea**

**Between 2000-2002, Grant Parish reported an annual average of 52.6 cases of gonorrhea per 100,000 population.**

- Much lower than the 199.4 found across the RFSA.
- Much lower than the 286.3 reported throughout Louisiana.
- Much lower than the 125.8 reported nationwide.

**Gonorrhea Incidence**

(By Region; Cases Per 100,000 Population; 2000-2002)

Note: • Rates are cases per 100,000 population.
Between 2000-2002, Grant Parish reported an annual average of 0.0 cases of primary-stage/secondary-stage syphilis (as characterized by progression of symptoms) per 100,000 population.

- Much lower the RFSA incidence rate.
- Much lower than the statewide rate (11.2).
- Much lower than the 2.2 incidence rate reported nationwide.

**TREND**: After a sharp decline in the early 1990s, primary/secondary syphilis incidence rates have not changed dramatically over the past several reporting periods. This trend is mirrored both statewide and nationwide.
Between 2000-2002, Grant Parish reported an annual average of 151.4 cases of chlamydia per 100,000 population.

- Much lower than the 368.4 reported throughout the RFSA.
- Much lower than the 409.7 reported across Louisiana.
- Much lower than the national incidence rate of 270.8.

**TREND:** Chlamydia incidence is on the rise in Grant Parish, as it is regionally, statewide and nationwide.

**Chlamydia Incidence**
(By Region; Cases Per 100,000 Population; 2000-2002)

**Chlamydia Incidence**
(By Region; Cases Per 100,000 Population; 1997-2002)
In Grant Parish, the 2001-2003 annual average acute hepatitis B incidence was 0.0 per 100,000 population.

- Below the 2.8 incidence rates found for the RFSA and the State of Louisiana.
- Below the 2.9 incidence rate reported nationwide.

**TREND:** Acute hepatitis B rates in Grant Parish have declined over the past decade.
More than three-fourths of Grant Parish residents (78.1%) currently own their home or condominium.

- Higher than the percentages reported across the RFSA.

**TREND:** Significantly lower than reported in Grant Parish in 2002.

Another 7.5% of Grant Parish adults rent a house or apartment, and 9.4% live with parents or other relatives.

Source: PRC Community Health Surveys, Professional Research Consultants. [Item 116]

Note: Asked of all respondents.

State and national data not available.
When asked to evaluate the condition of local housing, 46.4% of Grant Parish residents gave “excellent” or “very good” responses; in contrast, 19% said “fair” or “poor.”

- Responses this year are similar to 2002 findings.

Local adults are clearly divided in terms of perceptions of neighborhood housing. Residents more likely to perceive neighborhood homes to be “fair” or “poor” include:

- Those living at low or very low income levels.
- Blacks/African Americans.
- People who rent their housing.

### Perceive Condition Of Neighborhood Homes To Be "Fair" Or "Poor"

Note: • Asked of all respondents.
- Income categories reflect respondent's household income as a ratio to the federal poverty level for their household size:
  "very low income" = below poverty; "low income" = 100% to 200% of poverty; "middle/high income" = over 200% of poverty.
Housing Displacement

A total of 12.6% of Grant Parish respondents have had to go live with a friend or relative some time in the past two years due to a housing emergency (even though this may have been only temporary).

- Higher than the 8.6% reported across the RFSA.
- TREND: Marks a statistically significant increase since 2002.

Had To Live With A Friend/Relative In The Past Two Years Due To An Emergency (Even Temporarily)
(By Region; 2002-2005 Trend Data)

Adults more likely to report living with a friend or relative due to a housing emergency include:

- Those under age 64 (especially adults aged 18 to 39).
- Adults living at very low income levels.
- Blacks/African Americans.
- Renters.

Had To Live With A Friend/Relative In The Past Two Years Due To An Emergency (Even Temporarily) (Grant Parish, 2005)

Source: • 2005 PRC Community Health Survey, Professional Research Consultants. [Item 115]
Note: • Asked of all respondents.
• Income categories reflect respondent's household income as a ratio to the federal poverty level for their household size:
  "very low income" = below poverty; "low income" = 100% to 200% of poverty; "middle/high income" = over 200% of poverty.
Survey respondents were asked to evaluate the degree to which each of five youth issues is a problem in Grant Parish. These issues include: teen alcohol use; teen drinking and driving; teen drug use; teen pregnancy; and teen tobacco use. For each issue, respondents were asked if they see this as a “major problem,” “moderate problem,” “minor problem” or “no problem at all” for adolescents in their own community.

Of the tested youth issues, teen drug use was the biggest concern in Grant Parish (69.0% said this is a “major problem”).

- Over 50% of respondents also view teen tobacco use and teen alcohol use as “major problems” for local adolescents.
- Compared to responses throughout the RFSA, Grant Parish respondents were more likely to rate teen drug use and teen tobacco use as a “major problem.”

TREND: This year’s response for teen pregnancy as a “major problem” in Grant Parish marks a statistically significant decrease from the 48.0% reported in 2002.

TREND: This year’s response for teen drug use as a “major problem” in Grant Parish marks a statistically significant increase from the 49.9% reported in 2002.
